You can post this message to many newsgroups at a time, by simply selecting
a newsgroup near the top of the screen, hold down the SHIFT, and then select a newsgroup near the bottom of the screen. All of the newsgroups in/between will be selected. After that, you follow/do the basic steps, stated below
in this letter, except step #1. You can go to the page stated below in this
letter and click on a newsgroup to open up the newsgroups window. Once you've done this, in the same window go to 'OPTIONS', and then mark 'SHOW ALL NEWSGROUPS' and 'SHOW ALL MESSAGES'.
Now you can see all the newsgroups and you can apply easier the above tip.

==========
Now the WHY part:
==========
Out of 200 postings, say I receive only 5 replies (a very low example). I
made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who
just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5

and only 5 persons respond to each of the original 5, that is another
$25.00 for me, now those 25 each make 200 MINIMUM posts with my name at
#4 and
only 5 replies each, I will bring in an additional $125.00! Now, those
125
persons turn around and post the MINIMUM 200 with my name at #3 and only
receive 5 replies each, I will make an additional $626.00! OK, now here
is
the fun part, each of those 625 persons post a MINIMUM 200 letters with
my
name at #2 and they each only receive 5 replies, that just made me
$3,125.00!!! Those 3,125 persons will all deliver this message to 200
newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react I will receive $15,625,00! With a original investment of only
$6.00!
AMAZING! And as I said 5 responses is actually VERY LOW! Average is
probably 20 to 30! So lets put those figures at just 15 responses per
person.
Here is that you will make:
at #6 $15.00
at #5 $225.00
at #4 $3,375.00
at #3 $50,625.00
at #2 $759,375.00
at #1 $11,390,625.00
When your name is no longer on the list, you just take the latest
posting
in the newsgroups, and send out another $6.00 to names on the list,
putting
your name at number 6 again. And start posting again. The thing to

remember
is, do you realise that thousands of people all over the world are
joining
the internet and reading these articles everyday, JUST LIKE YOU are
now!!
So can you afford $6.00 and see if it really works?? I think so...
People
have said, "what if the plan is played out and no one sends you the
money? So
what! What are the chances of that happening when there are tons of new
honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, every day, with thousands of those joining
the
actual internet.
**REMEMBER, everyone needs to keep a record of who's playing
and who's being honest.**
** By the way, if you try to deceive people by posting the messages with
your name in the list and not sending the money to the rest of the

people
already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven
or eight weeks! Then he sent the 6 $1.00 bills, people added him to their
lists, and in 4-5 weeks he had over $10k.
This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may
want to buy mailing and e-mail lists for future dollars.
Make sure you print this article out RIGHT NOW! Also, try to keep a list of
everyone that sends you money and always keep an eye on the newsgroups to
make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY.
You don't need to cheat the basic idea to make the money!!
GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH.

Please remember to declare your extra income. Thanks once again...

LEGAL ? ? ? (Comments from Bob Novak who started this new version.) "People
have asked me if this is really legal. Well, it is! You are using the Internet to advertise your business. What is that business? You are assembling a mailing list of people who are interested in home based computer and online business and methods of generating income at home. Remember, people send you a small fee to be added to your mailing list.It
is legal. what will you do with your list of thousands of names? That's up
to you."
So, build your mailing list, keep good accounts, declare the income and pay
your taxes. By doing this you prove your business intentions. Keep an eye
on the newsgroups and when the cash has stopped coming (that means your name is no longer on the list), you just take the latest posting at the newsgroups, send another $6.00 to the names stated on the list, make your corrections
(put your name at #6) and start posting again.

NOTES:
*1. In some countries, the export of the country's exchange is illegal. But
you can get the license to do this from the post office, explaining the above statements (that you have an online business, etc. You may have to pay an extra tax, but that's OK, the amount of the incoming money is HUGE!

And as I said, a few countries have that restriction.
*2. You may want to buy mailing and e-mail lists for future dollars. (Or
Database or Spreadsheet software.)
*3. If you're really not sure or still think this can't be for real,
please
print a copy of this article and pass it along to someone who really
needs
the money, and see what happens.
*4. You will start getting responses within 1-2 weeks, it depends.

Tony (and anyone else experiencing the problem),
Are you sure that it is ignition noise you are hearing? Ford products
are infamous for fuel pump noise. You can tell if it is fuel pump noise
by doing the following:
Turn the radio on but do not start the engine. Listen carefully and if
you hear the noise briefly - 1 to 3 seconds, you are hearing the fuel
pump build up pressure in the fuel line. If you do not hear the noise,

then it is more likely to be ignition noise. Don't overlook other
possible sources, gauges, wheel static etc.
Assuming that you do have fuel pump noise, do the following: Go to your
favorite Radio Shack and but a 0.1 uF capacitor. Lower the gas tank and
install the cap across the wires to the fuel pump. I'ts mounted inside
the tank. Ford makes a noise filter that is quite effective but the
cost is somewhere near $70.00, so I'm told. I have a friend in Florida
who did the cap job on his Ford pickup with amazing results. He has 2
fuel tanks and added the cap to the tank he uses most often. He then
made an A - B comparison and couldn't believe the difference.
I am going to make the same mod on my Ford Ranger when I get the time.
Hope this helps.

4027. Re: Emergency Communication - Ham vs Cell

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-11 00:00:00 UTC
From: bdiaz@my-dejanews.com
Message-ID: <6tca8nnp1@nnrp1.dejanews.com>
Source record: 132221
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.policy

One very important area that people forget about in Emergency Comminications is training. Assume that the cell phone system is working: Many might call 911 about a fire, but the lesser things might get missed. In an emergency knowing the status of the situation is very important: What roads are open, which roads are blocked? Where do we have power, where is the power out? Can we really count on people with cell phones to provide the critical information?

There is no reasonable way to get any form of understanding of the level of the damage from just cell phone calls. On the other hand, Hams that take part in Emergency communication groups, receive the practice and training needed so that they will be able to provide the critical communication net in an emergency.

I do take some pride to being a part of TARA (Torrance City's emergency communication group) and DCS (LA County's emergency communication's group). Every week we go through our net and depending of who's turn it is, each of us will work as Net Control. It all pays off, this year we've had 2 "little" emergencies we (TARA) took care of.

I know that there are lots of other Hams that are in this User Group that are a part of similar emergency groups and some have taken part in several "big" emergencies. I wish that EVERY Ham would join up with their local group that prepairs for such events. While no one wants things to go wrong, things do go wrong, and it better to be a part of the soultion, than a part of the problem.

73,
Bob

IMHP - it's what the traffic will bear. Some prices are very high but there always seem to be buyers willing to pay. Some prices are reasonable, like the scanner and receiver I just auctioned off. I got several bids for each but not more than I really thought the items were worth if I were the bidder. On the other hand, I bid on a scanner and was outbid by about double. I didn't think it was worth what soemone finally paid, but who's to say. I eventually bought that item at RS for even less then I was going to pay if I had been the high bidder. Go figure!
It's fun to "shop" Ebay and see what's going for what price. And you never know, your bid may be the high one.

> kf6qgl@usa.net

I looked up your callsign and saw that your current status is Tech Plus.

A while back I was a Tech Plus too and I considered getting the Ranger rig. I'm VERY thankful that several Hams talked me out of it. After some looking I purchased the Ten-Tec Scout with the 10 meter module.

While the Scout costs around $600 with the hand held mike and one band module, I feel it's a much better radio than the Ranger. Signal reports on my transmitted audio are always very good and as far as receive audio, it performs VERY well. The Scout is VERY easy to operate and is one solid little rig. (OK, so it puts out 50 watts, but that's just 1/2 an S unit less than the 100 watt rigs.)

When I upgraded to General (and later to Advanced) I was VERY happy I did not purchase a single band radio. I purchased the Scout with a 10 meter module, but when I upgraded, I purchased other modules. It cost me less than $100 to add 3 more modules; 40 meter, 20 meter, and 15 meter. OK, so I don't have every band, but I sure have a lot of fun with the bands I can work.

Given the changes that may be coming, we may see a 5 WPM General License soon. If so, you'll want to expand beyond 10 meters. The 10 meter band is a lot of fun and I love working on it, but there are times it's dead. Being able to jump to another band, like 20 or 40, and find some HF action will be important to you.

73,
Bob

I have a Yaesu FT530 for sale used little and always in a soft case, comes with box and manual, antenna, 2 watt and 5 watt pack, 2 soft cases and dry cell pack, this is a dual band radio with out of band mods done, you will not find a better looking one out there. Best offer over $230 and you pay shipping and COD charges or send me Postal MO and I'll pay shipping. US .all 50 states and Canada.

James

I'm a confused newbie looking for a first rig. I've pretty much settled on 10 m for price and DX and have seen listing for used HR2510s and new President Lincoln radios. Perhaps one is by Uniden. Are these the same? Are they a good inexpensive first ham radio?

I have a like new Toshiba Libretto 50 with original accessories I'd like to swap to a high end receiver (R8B, Lowe 250E, etc) or late model HF transceiver, FT900 or similar.

lets hear what you have for swap...

I can get a good idea judging from the price of the gear, its condition, and the demeanor of the seller. If the seller seems honest, the gear is clean, and the price is what you'd expect to pay then you're probably ok. Always ask for the seller's name and phone number when buying expensive items. Don't be afraid to ask for a photo ID if that makes you feel better. An honest seller shouldn't complain one bit...

The more hamfests you attend, the more "hamfest smart" you'll become in looking out for "fast talkers" and the like. Sooner or later you'll be able to spot them a mile away!

I have seen mention of it on their Web Site occationally and from several
people who work at ADI/Premier.
They said they were coming out with the two new handhelds that were just
released (220 MHZ etc). They
said that after that they were considering a $500 bare bones HF radio sort of
like a TS-50 Kenwood .
They asked for ideas from hams who visited their Web Site on What they wanted
but stressed they
want the price under $500 so it wouldn't have DSP/Auto Tuner/ etc. I wish they
did come out with it
as it would fill a void in the MARKET.

See August QST 1998 page 33 bottom right . It says " ADI also hopes to market a low-cost,lightweight HF transceiver under the PRYME label.

Also see page 34 right bottom of the page. "Several small HF Tranceivers priced WELL
BELOW the $1000 mark also turned up at Dayton this Year". QST doesn't say the names but my guess is the Major manufacturers are introducing new introductory HF
Radios for the next Sunspot Cycle. The Yeasu FT-840, ICOM 707, Kenwood TS-50 are AGING and due to be replaced.
Take care, Sammy

>Is it me or do anyone thinks that the prices on the auctions on
>ebay are outrageous?

I think (1) there are a lot of collectors hoarding things they can't really use, expecting a stock market crash on 1-1-Y2k and wanting swappables; (2) a lot of con merchants are pretending that beer mats are valuable; (3) a lot of people finally convince their insurers by auctioning a valuable back to themselves; but they have to place an outrageous Reserve in order to do that without any risk of selling.

All of this makes for many outrageous prices not only on eBay.

By the time you have determined that, the battery is already discharged.

Some devices-camcorders, laptops- have such circuitry but it's obscure
as far as ham radio seems to be concerned. Evidently it is a voltage drop over
time measurement of some kind, measuring the state of the battery as a
function of it's exact voltage considered against fully charged voltage and
discharged voltage levels. There is a discharge voltage curve but it's
pretty flat on the charts I've seen. Must be a sensitive circuit. And it has
to be displayed, or computed from a VM reading.

The best plan is to buy a AA battery pack for the HT in question,
and plan to use alkaline AA cells.
They can be had at the local Sam's Club (Toshiba brand) for ~$10 and change
for a brick of 40 cells, about $0.27 per cell. And they are very good quality.
I keep a couple of bricks on hand. Shelf life is excellent and I haven't seen
one leak yet, as opposed to a major brand that advertises with a rabbit
whose leaking is almost predictable.

Sometimes conductive grease is worse than no grease.
After aging, it dries up and becomes more of an insulator.
Some industries have gotten away from using it, instead they
ensure that both mating surfaces are clean and flat.

Another thing to look for in the power modules is what looks
like a broken lead...if the power modules overheats the solder
connection can become molten and flow away from the wire.

I have an ICOM- 701 with Power supply for sale.

The unit is in showroom condition.

Excellent working condition.

Comes with built -in dual VFO.

160/80/40/20/15/10 meters.

LSB/ USB/ CW/ RTTY

Comes with original ICOM power supply and hand mike.

I am asking $ 300.00 or best offer.

My phone number is 403-568-4312 only in eves or weekends

I am in north central Alberta.

My ham call is VE6OGM

Shipping cost I would estimate at about $30.00

You can email me at:

jmanus@telusplanet.net

4072. MFJ mobile antenna any good?

Source record: 132315

Place the radio in memory mode. Turn the tuning knob and the rotary switch back and forth at the same time. You will confuse the radio and occasionally the display will change to 0.000.0 Mhz, try to catch this by stopping your knob turning. Once you have caught it and the display is reading 0.000.0 Mhz press write to save it to a memory.

You can now recall this memory and tune up. Don't tune down or you will wrap to 29.999.9 Mhz and you cannot go back to 0.

If you or the seller don't have some way of doing a test,
assume it doesn't work and pay accordingly. This might be tempered by
whether you know the person.

I have taken antennas (hamsticks) and power supply to hamfests specifically
for this purpose when shopping for large ticket items. The inconvenience is
well worth avoiding getting burned.

Aw come on fellows! There is absolutely no need for a confusing, complex program to find the position of any satellite in synchronous orbit! There is a simple, single page nomograph in which the satellites suborbital point is entered and the azimuth and elevation is obtained.

If there could ever be a better example of why it takes a computer to really screw up something simple, this is it!! Cliff K7RR

If you got the cash, and you want to buy. when you see something you
want, ask to see it work, if you get ANY EXCUSE, Keep walking.
I have sold hf rigs, and once, i took a half dozen Harris 1 KW amps,
and made prior arraingement for power. Serious sellers will have a
test setup. If it is a local hamfest, go to his or your QTH to try it
out. Preferably your QTH, will give you a chance to see how it works
with your antennas. and remember Caveat Emptor.

Bob

I discovered this trick for the R71A and published it in
the April 1985 issue of Monitoring Times magazine (pg. 35):

Tricking the ICOM R71A to Tune Below 100 KHZ

Bob Parnass, AJ9S

The ICOM R71A general coverage receiver is designed for VLF
reception down to about 97 kHz.

The following steps will confuse the microprocessor-based
controller sufficiently to permit reception down to 0.0 kHz:

1. If all 32 memory channels contain frequencies, use the
FUNC and CLEAR buttons to clear a memory channel.

2. Place VFO/M switch into the M (Memory) position.

3. Using all the manual dexterity you can muster, rock
the MAIN TUNING knob back and forth, while
simultaneously rocking the MEMORY-CH rotary control to
switch back and forth between a memory channel with a
frequency in it and a clear memory channel.

Continue rocking both the controls until a frequency
of 0.000.0 appears on the digital display.

4. Depress the WRITE button. This stores the 0.000 MHz
frequency in a memory channel.

You can now rotate the MAIN TUNING knob clockwise to
tune up from 0.000 MHz to the frequency you want. Be
careful: if you rotate the MAIN TUNING knob
counterclockwise, the radio will immediately revert to
29.999 MHz.

To tune below 100 kHz in the future, just recall the 0.000
MHz frequency from the memory channel and use the tuning
knob to tune upward. That way, you don't have to use two
hands every time you tune to a VLF frequency.

I used a Wavetek 180 sweep/function generator to verify that
the R71A is indeed receptive to signals below 100 kHz.

I have looked at several sites that have software for RX/TX 1200 and 9600 baud VHF Packet radio but don't seem to find good information as to how one might wire things up.

http://www.muenster.de/~welp/sb.htm
http://www.forthnet.gr/sv2agw/start.htm
http://dl0td.afthd.th-darmstadt.de/~flexnet/

I have a Soundblaster 32 (non-AWE) with an extra 2 megs onboard memory (they accept standard 30 pin simms).

I have a HTX-202, an amp, and the information necessary to tap the HTX-202 for 9600 baud.

Specific Questions:

1. What software programs are folks using successfully for 1200 and 9600 baud packet
with a Soundblaster board?
2. Is some sort of interface device required between the rig and the SB board?
3. What hardware wiring system are folks using?
(Anyone have the precise details for a HTX-202?
4. Anyone seen something for Clover?
(I've seen the listings of RiTTY and PSATOR for Pactor, RTTY and Amtor)

Nah, I can do better than that. Mine's legal. People get ripped off all the time. What irks me is that someone who can be as easily tracked as a ham operator through FCC records would be stupid enough to think they're going to get away with it. It's like finding the dog digging in the trash for the 1000th time...it would be impolite not to provide a size 12 reminder just below the tail. I did like the nice touch of having "f--- this and f---that and f--- you" and then putting the stars in the "a---" at the end. It makes you wonder. <g>

>In this type of
>situation, how do you evaluate a radio before deciding to buy it?

For some items, its just a crap shoot! I begin by assuming that there is something wrong with the equipment, and then base my decision on what the problem will probably be, and how hard or expensive the repair will be. I look closely, and breath deeply while doing so! You definitely want a "non-smoker!"

If you are not able to make a judgement based upon physical inspection, ask the seller if he will give you a money-back guarantee as to the functionality of the gear: many will. I was at a hamfest with a new ham, as his advisor on the purchase of a first rig. We settled on a Drake R4/T4 pair that was described as "In good working condition, just recently taken out of line." I asked if a warranty would be offered, and it was. So we took the gear home to find a disaster. To his credit, the seller did give us a refund, so all we lost was time, and the opportunity to have chosen something else. The equipment, it turned out, was from the estate of a friend of the seller, and he was "sure" it had been in use!

brianj@televar.com wrote:
>
> Here's a good question for the group: When looking at radios and other
> equipment at a hamfest, how can you judge the condition of the equipment? I

First thing I do is ask the seller, "Is there anything wrong with it."
If he/she says no, then I look it over. Assuming that the seller has no
way to power the device up, I will ask if they have a problem if I plug
it in, check it out, etc. Many hamfests have a test bench set up so
that you can check out a prospective purchase. At some of the larger
hamfests I attend, I will actually take test gear along with me. I have
two communications service monitors. A CE50A and a Ramsey COM3. I
usually take the COM3 with me since that will tell most of what I want
to know about a radio and it is fairly light and portable. I also take
an antenna analyzer, VOM meter, patch cables, and assorted small tools.
The tools, and antenna analyzer all fit in a small carry case and the
COM3 has a handle and both store easily in my car.

There is no 100% guarantee you won't get burned but most of the time if
you look your prospective purchase over carefully, you will be OK.

All the stuff on this thread is nothing, when set against the need for hams
because the phone system, cell phones included, STILL clogs up when
disaster strikes. So the need for hams is still here. Read the ARRL
Journal (QST mag) section on this. They have only what is reported to
them,
too.
It may be that we are only now seeing how BAD the overloads were back in
the
good ole days. Or maybe we still ain't seen it all.
In Oklahoma City, after the Murragh Blast, the authorities asked civilians
to
stay off the cell phone systems if they could, and they still used over a
hundred hams at a time, as it was told to me. Where I sat waiting to go
out,
there were 30-40 other hams waiting too. There were 3 or 4 locations, I
believe.
We still couldn't do enough. There was a lot of depression over that one.

There always is. I don't expect it to let up any time soon.
"I don't know a good definition for insanity, and I don't know anyone who
does.
"Even the shrinks can't agree, so they dont know either.
"BUT, I can give a damn' good example:
"That is when the authorities call the TV stations and say there is
something
"very bad coming, get in shelter, don't stop to turn off the TV, GO NOW !
"An hour or 6 earlier, they called a buncha hams and said
"Will you go sit on a hilltop?
"AND WE GO!
"At our own expense.
"LOOKING FOR SOMETHING WE HOPE WE DON'T FIND!
"If we did find it we couldn't eat it. Or stuff it and hang it on the
mantel.
"Like a young storm chaser said to an old one,
"What do you do if you catch one?
"The old man answered,
"Throw it back. It's too small."

> to produce. Personally, I would gladly pay the cover price for the
> catalog if requested; it's well worth it ! But as you didn't buy it,
> you don't know, do you ?
I receive many catalogs free that have not only pretty pictures advertising
the seller's products, but useful information and interesting stories as
well. They receive prominent places on my bookshelves, which gets their
name seen by me several times a day (a marketer's DREAM). I, in turn,
recommend their catalogs to my clients, who usually end up buying from
these companies.
If Radio Shack wants me and my clients to look at pictures of their wares
in their high-quality publication on quality paper, they will either make
it worth the price of a good magazine to me, or they will give it to me
at no cost to me and consider it to be part of their advertising budget.
Perhaps all those years of REQUIRING name/address/phone number to buy a
battery, then sending their high-quality publication on quality paper to
everyone who buys a $3 battery once a year, has caught up with them. Or
maybe the marketroids who glide around Corporate all year chanting, "I
can sell AIR! I can sell AIR!" have taken it too much to heart and begun
to gloat that people will pay $4 to get their advertising. Whatever it
is, at some point someone there will realize this isn't the Victoria's
Secret catalog and this isn't working, and they'll start trying to get
their advertising distributed as widely as possible to a properly targeted
market instead of what they're doing now or have done before.

Well John, all they would have to do is put a CW button on the cell phone
because we all know that "CW gets through when nothing else can".

Subject: Emergency Communication - Ham vs Cell
John D. Seney, WD1V, said:
> Everyone has a cell phone so the service aspect in terms of catastrophes
> is fading fast. Kill all of my power and I can still communicate. This
> is 1998 not 1967. Eisenhower is dead - admit it!
> John D. Seney, WD1V
In June of this year, Elam Stolfus, TG7XQS, said on 20 Meters:
"Armed bandits kidnapped my wife, daughter, a nurse, and a visiting
missionary. Ham radio is my only means of communication to the outside
world.
Can you help us?"

Ed Petzolt, K1LNC heard the call for help, and amateur radio went to work.
Armed gunmen had kidnapped four missionaries from a compound in northern
Guatemala. Among those held for 2-million quetzales (around $300,000)
ransom
were the Barbara and Anita Stolfus, the wife and daughter of Elam Stolfus,
TG7XQS, and two others, including Otto, a missionary from Belize, and a

nurse, Jenni. Missionary Elam Stolfus promptly turned to ham radio, his only
connection to the outside world, and K1LNC and TG7XQS coordinated operations
of the Guatemalan police and armed forces. The bad guys lost, and all the
hostages were returned safely. Try that on your cell phone!

>73, DavidC AA1FA
Indeed that is the problem with ham radio today and in the future.
Enforcement. frankly a bill that allowed and required the FCC to
collect (in lumps at renewal) a few dolars a year form us Hams and to
reserve it for neforement, would do more for Ham radio than any Bill I
have seen lately
When outsiders look at Ham radio, Like I have too as part of
my job I see clumbs going every which way, and nothing worth the
trouble of planing to deal with. This is also dangerous to Ham radio

Subject: Did the Hams just lose 10 meters?
Exactly. Solid copy to a JX yesterday evening at 28.010 with 35 watts
using a 22 year old rig, a 1/4 wave ground plane and practically no
filter to speak of. If y'all don't want to bother with 10 meters
because of QRM, I'll be happy to have the extra clear space. The band
is far more usable and QRM far less obnoxious than 20 meters with it's
100,000 watt California and PR flamethrowers blazing away at 500 wpm
and overloading the front end of this rig to the point where I can't
hear my neighbor. 10 meters rocks.

From: sepsteinx857@my-dejanews.com
Subject: POOR RESPONSE
Alinco is known for poor response. According to a former employee,the
reason
for one is that their U.S.branch manager is not a resident and rarely
visits
the branch. The person who claims to be the manager is actually the
"assistant" manager, more like a messenger. This explains why they have
poor
excuses for, from my point of view, half decent marketing policies. From my
speculation, I would expect the DJ-C1T (card radio mono band), DX-77(the
lowest HF and highest CB radio), and possibly VHF and dual band mobile
radios
will be on special sale from a mail-order discount store starting probably
October; this will outdo the existing dealers, but Alinco doesn't seem to
care about the past relationship with old dealers, and therefore, the old
users, who paid higher prices. Good thing, if any, is the DJ-X10T can
receive
blocked cellular band by reprogramming. Now you don't get this from Icom.

From: brimprod@aol.com (BrimProd)
Subject: Want to make money fast?
Get 6 separate pieces of paper and write the following on each piece of paper:
PLEASE ADD ME TO YOUR MAILING LIST.
$1 US DOLLAR PROCESSING FEE IN ENCLOSED.
PLEASE WRITE YOUR NAME, ADDRESS, CITY, STATE, ZIP ON THE PAPER.
(THIS IS KEY. THIS IS WHAT MAKES IT LEGAL SINCE YOU ARE PAYING FOR AND LATER OFFERING A SERVICE).
Now get six $1.00 bills and place ONE inside EACH of the 6 pieces of paper
so the bill will not be seen through the envelope to prevent theft/robbery
(Using colored paper will help hide the dollar bill). Then, place one paper
in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase and a U.S.
$1.00 bill. Mail the 6 envelopes to the following addresses:
#1 George Powel
15582 Grape Creek Road
Danville, IL 61834
#2 Brad Wright
16363 N 300 W
Covington, IN 47932
#3 Max Farr
2720 B 1/4
Grand Junction, CO 81503
#4 Anthony Marcus
32 N Macquesten Pkwy
Mount Vernon NY
#5 I.M.O.
1966 Tice Valley Blvd. #502
Walnut Creek, CA 94595
#6 Tim Keller
3231 Betsy Ln.
Herndon, VA 20171
USA
STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list. (If you want to remain anonymous, put a nickname, but the
address MUST be correct. It, of course, MUST contain your country, state/district/area,zip code, etc!!! You wouldn't want your money to fly away, would you?!?!).
STEP 3: Now post your amended article to at least 200 newsgroups.

Remember,
200 postings is just a guideline. The more you post, the more money you make!
NOTE: IN MANY NEWSGROUPS THERE ARE PEOPLE THAT DELETE THIS KIND OF MESSAGES
I RECOMMEND YOU TO POST 1 OR EVEN 2 TIMES A WEEK TO 300 NEWSGROUPS SO OTHER
PEOPLE CAN SEE YOUR MESSAGES. THIS IS A WAY TO INCREASE THE POSSIBILITIES
TO GET MORE MONEY!!
Don't know HOW to post in the news groups? Well do exactly the following:
HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:
The fastest way to post a newsletter:
Highlight and COPY(Ctrl-C) the text of this posted message and PASTE(Ctrl-V)it into a plain text editor (as Wordpad, Scrapbook, even AOL's mail)
and save it. After you have made the necessary changes that are stated above,
simply COPY(Ctrl-C) and PASTE(Ctrl-V) the text into the message composition
window, after selecting a newsgroup, and post it! (Or you can attach the file, without writing anything to the message window.)
If you have Netscape Navigator 3.0 do the following:
1. Click on any newsgroup like normal, then click on 'TO NEWS'. This will
bring up a box to type a message in.
2. Leave the newsgroup box like it is, change the subject box to something
flashy, something to catch the eye, as "$$$ NEED CASH $$$?!!", "READ HERE!$!$!$" or "$$$!!!MAKE FAST CASH!!!$$$". Or use your own subject title.
3. Now click on 'ATTACHMENTS'. Then click on 'ATTACH FILE'. Find your file
on your Hard Disk (the one you saved from the text editor). Once you find
it, click on it and then click 'OPEN' and 'OK'. You should now see your file name in the attachments box.
4. Now click on 'SEND'/'POST'. You see? Now you just have 199 to go!!! (Don't worry, it's easy and quick once you get used to it.)
NOTE: All the versions of Netscape Navigator's are similar to each other, so you'll have no problem doing this if you don't have Netscape Navigator 3.0.
(FOR A QUICK TIP)! Netscape Navigator 3.x and above)
You can post this message to many newsgroups at a time, by simply selecting
a newsgroup near the top of the screen, hold down the SHIFT, and then select a newsgroup near the bottom of the screen. All of the newsgroups in/between will be selected. After that, you follow/do the basic steps, stated below

in this letter, except step #1. You can go to the page stated below in this
letter and click on a newsgroup to open up the newsgroups window. Once
you've done this, in the same window go to 'OPTIONS', and then mark
'SHOW ALL NEWSGROUPS' and 'SHOW ALL MESSAGES'.
Now you can see all the newsgroups and you can apply easier the above
tip.

==========
Now the WHY part:
==========
Out of 200 postings, say I receive only 5 replies (a very low example). I
made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who
just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5
and only 5 persons respond to each of the original 5, that is another
$25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and
only 5 replies each, I will bring in an additional $125.00! Now, those 125
persons turn around and post the MINIMUM 200 with my name at #3 and only
receive 5 replies each, I will make an additional $626.00! OK, now here is
the fun part, each of those 625 persons post a MINIMUM 200 letters with my
name at #2 and they each only receive 5 replies, that just made me
$3,125.00!!! Those 3,125 persons will all deliver this message to 200
newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react I will receive $15,625,00! With a original investment of only
$6.00!
AMAZING! And as I said 5 responses is actually VERY LOW! Average is
probably 20 to 30! So lets put those figures at just 15 responses per
person.
Here is that you will make:
at #6 $15.00
at #5 $225.00
at #4 $3,375.00
at #3 $50,625.00
at #2 $759,375.00
at #1 $11,390,625.00
When your name is no longer on the list, you just take the latest posting
in the newsgroups, and send out another $6.00 to names on the list, putting
your name at number 6 again. And start posting again. The thing to remember
is, do you realise that thousands of people all over the world are joining

the internet and reading these articles everyday, JUST LIKE YOU are
now!!
So can you afford $6.00 and see if it really works?? I think so...
People
have said, "what if the plan is played out and no one sends you the
money? So
what! What are the chances of that happening when there are tons of new
honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, every day, with thousands of those joining
the
actual internet.
**REMEMBER, everyone needs to keep a record of who's playing
and who's being honest.**
** By the way, if you try to deceive people by posting the messages with
your name in the list and not sending the money to the rest of the
people
already on the list, you will NOT get as much. Someone I talked to knew
someone who did that and he only made about $150.00, and that's after
seven
or eight weeks! Then he sent the 6 $1.00 bills, people added him to
their
lists, and in 4-5 weeks he had over $10k.
This is the fairest and most honest way I have ever seen to share the
wealth of the world without costing anything but our time!!! You also
may
want to buy mailing and e-mail lists for future dollars.
Make sure you print this article out RIGHT NOW! Also, try to keep a list
of
everyone that sends you money and always keep an eye on the newsgroups
to
make sure everyone is playing fairly. Remember, HONESTY IS THE BEST
POLICY.
You don't need to cheat the basic idea to make the money!!
GOOD LUCK to all and please play fairly and reap the huge rewards from
this, which is tons of extra CASH.

Please remember to declare your extra income. Thanks once again...
****
LEGAL ? ? ? (Comments from Bob Novak who started this new version.)
"People
have asked me if this is really legal. Well, it is! You are using the
Internet to advertise your business. What is that business? You are
assembling a mailing list of people who are interested in home based
computer and online business and methods of generating income at home.
Remember, people send you a small fee to be added to your mailing
list.It
is legal. what will you do with your list of thousands of names? That's
up
to you."

So, build your mailing list, keep good accounts, declare the income and pay
your taxes. By doing this you prove your business intentions. Keep an eye
on the newsgroups and when the cash has stopped coming (that means your
name is no longer on the list), you just take the latest posting at the
newsgroups, send another $6.00 to the names stated on the list, make your corrections
(put your name at #6) and start posting again.
****
NOTES:
*1. In some countries, the export of the country's exchange is illegal. But
you can get the license to do this from the post office, explaining the
above statements (that you have an online business, etc. You may have to
pay an extra tax, but that's OK, the amount of the incoming money is HUGE!
And as I said, a few countries have that restriction.
*2. You may want to buy mailing and e-mail lists for future dollars. (Or
Database or Spreadsheet software.)
*3. If you're really not sure or still think this can't be for real, please
print a copy of this article and pass it along to someone who really needs
the money, and see what happens.
*4. You will start getting responses within 1-2 weeks, it depends.

The linux soundmodem driver should work nicely, although I'm having
audio level problems getting it to receive correctly here.

> 2. Is some sort of interface device required between the rig and the SB
> board?

From what I read on the linux-hams mailing list, it should be okay to connect
the speaker out direct to your line in, or maybe use an audio transformer
(8 ohms to 1k ohms or so). The other direction is probably okay too, although
in my case some circuitry is required to combine the PTT and audio signals
(it's a Yaesu FT-411 handheld).

Those auctions are real scams. I just looked at the one ZDnet is
promoting, apparently run by Egghead. They show required minimum bids
for some items equal to everyday retail prices I've seen. And then you
add an inflated shipping cost.

Caveat Emptor!

4100. New ADI HF radio?

Tony (and anyone else experiencing the problem),

Are you sure that it is ignition noise you are hearing? Ford products are infamous for fuel pump noise. You can tell if it is fuel pump noise by doing the following:

Turn the radio on but do not start the engine. Listen carefully and if you hear the noise briefly - 1 to 3 seconds, you are hearing the fuel pump build up pressure in the fuel line. If you do not hear the noise, then it is more likely to be ignition noise. Don't overlook other possible sources, gauges, wheel static etc.

Assuming that you do have fuel pump noise, do the following: Go to your favorite Radio Shack and but a 0.1 uF capacitor. Lower the gas tank and install the cap across the wires to the fuel pump. I'ts mounted inside the tank. Ford makes a noise filter that is quite effective but the cost is somewhere near $70.00, so I'm told. I have a friend in Florida

who did the cap job on his Ford pickup with amazing results. He has 2 fuel tanks and added the cap to the tank he uses most often. He then made an A - B comparison and couldn't believe the difference.

I am going to make the same mod on my Ford Ranger when I get the time.

Hope this helps.

4102. Re: Buying at hamfests

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-11 00:00:00 UTC
From: GHANSON@Maine.edu
Message-ID: <98254.082947GHANSON@Maine.edu>
Source record: 132343

Some hamfests have a test table set up so you can run a piece of gear
before you bring it home. There are some BASIC things you can do to
protect yourself. 1. Give it a sniff test! Smell burned? Say goodbye.
2. The stripped screw test...Look at the hardware. Are the screws
stripped or worn? Does the sign say Never modified? Modify your walk
to the next table. 3. The dealer test. Now not every guy who shows up
at a hamfest with a U-haul filled with electronics is a dealer, but the
chances are greater his stuff will have been bought from someone else
and marked up. I would rather buy from an individual with a callsign
than a dealer with truckload of someone elses problems. (lighten up
guys...not all dealers are crooks, and not all individual sellers are angels..)
4. The callsign test. If the guy hasn't gat a call or says the gear belongs
to someone else and can't (or won't) supply a name...Walk on.
5. The story test. If there is a big story other than "I used it every day
and it works perfectly..." Say so long.
If I am buying anything of substance I get a name and phone number. I
have bought lots of used gear and have had only one problem that was
quickly resolved with a phone call and a trip to the local I bought the rig
from.
Oh yeah...6. The box and manual test. Hams are notorious for saving
everything that came with there radios. The first thing a CBer does
upon getting a new radio is to throw away the manual, box, and
reciept. No manual? No sale.
These are the things I look for. The more problems the lower the worth
of the piece in question....
All the above are IMHO...73 greg/W1XZ

Skip,
I do have SL6440 ICs.
Can send you (from SF Bay area).

I think most people don't realize that many of the outrageous prices on Ebay are NOT real !!

So far eBay has made two changes: Several weeks ago which added a key to each bid form. With a little work, programmers were able to get around this. Now eBay is about to make a new change, which will randomly change security methods, making it almost impossible to write a snipe program. Now eBay says sniping is still allowed, but automated programs won't work anymore. Why disable automated programs? Because it allows "bid robots" to roam freely on eBay. What do they do? They bid insane amounts on thousands of items and hours... with no intention of paying, bumping out people who would. Sniping is the practice of waiting to submit your bid seconds before the auction closes making it impossible for anyone to place a bid after you.
As you can see, thousands of bids per hour are being made that are completely bogus!
If a bid is so outrageous that it doesn't seem real, it probably isn't!

Interesting I was not aware this was hapening. Has anyone here sold
an item on ebay where the successful bidder could not be identified?

4110. IC706MKII BCB Sensitivity

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-11 00:00:00 UTC
From: "Michael St. Angelo" <mstangelo@worldnet.att.net>
Message-ID: <01bddda1$dbc780c0$d7af4e0c@mstangelo>
Source record: 132351

I've noticed the sensitivity of my 706mkll is very poor in the AM
broadcast
band, especially from 1400khz down. With an 8 ft, piece of wire in the
antenna jack I can barely hear powerhouse 50kw stations like WABC or
WCBS from a distance of 45 miles.

The manual only spec's the BCB sensitivity at 1Mhz and it it quite poor,
but it's hard to believe it is this bad.

Anyone with similar experience out there?

Mike St. Angelo

I haven't had this happen to me (yet), but I know I've seen many items re-listed a few days after the auction closed, with a note indicating that the seller had been "stiffed", or the buyer never responded to the seller's emails. Sounds like auto-sniping to me.

Actually, I've sold things on eBay for prices that astonished me, and I have yet to be stiffed by a buyer (at least on a high-$$$ item; I have been stiffed on a couple of nickle-n-dime items). However, you're right; there are plenty of items that close at totally unrealistic prices, and I'm certain that no one, even a rich dude with lots of money, would bid that high.

Nope. I've got several items on ebay right now that seem pretty normal prices. The Heath amp is a little low and Philmore chrome mono tube preamp seems a little high... But it is NOS unused in it's original box w/ paper work and parts bag.... - the S&G safe lock seems a bit light - but I figure there's just not that much demand for that kind of high secruity lock... The plasitic model submarine kit at $52.00 is just about right - I paid $40 ea. from a dealer for two of them about a year ago - so like I said - that seems about right... The Mini Pops rhythm unit who knows??? I'll be happy where ever that ends up (came on the Hammond A100 I bought a few months back - on ebay - which was super low!!! (you can't hardly touch a Hammond B3/C3/A100 class organ around here for under $3500 - and nice ones reach $6000 -- I bought a _really_ sweet A100 in great shape for $1500 - on ebay... The bid robots must have been asleep! (as were about a zillion others looking for a good deal on tonewheels!). Old multimeter at $1 is maybe a tad low - I've sold some pretty pricey stuff on ebay - never had a problem with the high bidder...

best regards...

>no way that cell service can provide this without elaborate conference bridges
>which may or may not be available in an emergency.

There are times when an "all stations" bulletin needs to be sent, and amateur radio excels at this, but most traffic *is* point to point. On a net, that requires everyone else to stand by while a pair of stations pass their traffic, then stand by as the next pair of stations pass their traffic, etc. This is very inefficient. Simplex nets can have the station pairs move off frequency to pass their traffic, then return to the net, but repeater based nets can't do that because the stations involved typically aren't in simplex range of each other. OTOH, cellular inherently provides this one to one capability. Multiway calling is also an option, though in some ways more limiting than a conference bridge.

>It is not only the equipment that amateur radio provides, but a trained
>communicator who knows how to get a message through under adverse conditions.

Amateurs may know how to use radios, but few are really trained in proper message handling procedures. Use of cellular requires very little training, but of course skill with message handling procedures is still required if verbatim copy is required. But many messages in disaster situations are tactical in nature, and can be handled verbally if the contact is direct between the responsible parties, and not handled through intermediaries such as amateur radio operators. Since virtually anyone can operate a cell phone, and since no license is required to do so, the responsible parties can use cell phones to directly communicate, eliminating the amateur middleman.

Where the amateur is of value is in off loading the communications chore from the responsible parties. In effect he acts as their secretary (amateurs prefer to call it shadowing). They can simply hand the radio to the principal after establishing contact, or take a formal message. But the same thing can be done via cellular or wireline or any other available communications method. Amateurs should consider themselves in the light of facilitating and off loading the communications chore from their principals, and less in the light of just being radio operators. In that

respect, a handheld cell phone and a phone list are valuable tools to have at hand. The amateur rig should be reserved for those situations where it serves best, typically to monitor "all stations" bulletins, or to handle point to point messages when cellular or wireline service is unavailable.

Even when amateurs are performing the eyes and ears role, and are in effect one of the principals to the information transaction, amateur radio may not be the best method to use. It is one tool, but the smart communicator won't limit himself to only a single tool. If amateurs have a failing in their role to be emergency communicators, I think this may be the major one. The idea that when all you have is a hammer, every problem looks like a nail, is often very much operative here. We should use the most appropriate tool, be that a ham rig, a cell phone, a CB, an agency radio, wired phone, the internet, or a notepad and a runner, for each message we are charged to handle. Different messages, and different situations, require different methods. We should strive to be flexible and efficient in order to get the job done in the best fashion possible under the circumstances. We're there to meet the needs of our served agency, whatever they may be, not just to play radioman.

Mike-

My experience with the old IC-706 compares with yours. I had about the
same results with the TS-50 as well.

I wonder if you could build a ferrite AM antenna using parts from an old
radio? If you had the tuning capacitor and ferrite rod connected in a
parallel tuned circuit, perhaps a link consisting of about 10% of the
number of turns on the ferrite rod, would match the receiver's 50 Ohm
input.

Unlike other auctions E-Bay only offers items for sale by
individuals and then they get a percentage of the selling price.
E-Bay sells nothing itself. Those high prices on E-Bay are the result
of _Human Nature_, people let their ego's get out of hand and then pay
ridiculous prices just to win the bid. I always buy items via
pricewatch www.pricewatch.com or off the misc.forsale newsgroups and
then sell via E-Bay.

4123. Buying at hamfests

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-11 00:00:00 UTC
From: brianj@televar.com
Message-ID: <6t9s83$lr4$1@nnrp1.dejanews.com>
Source record: 132458

Here's a good question for the group: When looking at radios and other equipment at a hamfest, how can you judge the condition of the equipment? I have noticed that in general none of the equipment is hooked up to a power source or antenna, so you can't turn it on and test it out. In this type of situation, how do you evaluate a radio before deciding to buy it?

73,
Brian KB7OIE

Hello.

There are a lot of cells in Japan that allow you to use as
tranceivers on cell frequency. No license required. Simplex
possible without ham license.

Just a tip.

>Are they a good inexpensive first ham radio?

They are both really CB sets. You'll do much better with the Uniden HR2600.
Many of the problems with the '2510 were corrected in the '2600. These included
automatic fm repeater offset, ctcss tone selection, switchable on/off RIT(the
'2510 always seemed to xmt 300HZ off freq, which wasn't a problem for CBers on
AM, but was a damn nusciance on ssb or cw), mike gain.

4132. ADI-201

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-12 00:00:00 UTC
From: Andre Konstantinov <konstan@worldnet.att.net>
Message-ID: <6tetad$d7a@bgtnsc02.worldnet.att.net>
Source record: 132118

I have a question.

When a new ADI-201 ships, does it come with receive 138-174 MHz or does it, new, receive ONLY 144-148?

The reason I am asking is that the manual claims that pressing <FUNC>+<CALL> while turning the power on resets the receive range back to just the ham band. However, it does not work -- it erases all the memories but my receive is still 138-174.

I do not remember what the range was when I first got the radio. But if it was only 144-148, I want that back (I like that the dial would wrap at 148 back to 144 and I have a scanner for other frequencies).

Let me know please!

4133. FT-990 SSTV

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-12 00:00:00 UTC

Jim,
Danbar sales also have a nicely illustrated free catalog of test equipment.
As far as prices go, a good rule of thumb for swap meet browsing is to divide the tucker price by an integer N where N= 3 to 5 :-)

If you get seriously into old test equipment, the manufacturers catalogs, from the appropriate era (1980 -1990) for most of the stuff being offered now, are worth looking out for. They are also often available in the reference sections of bigger public libraries.

Then you can always ask here; for example posting something like "what is the best scope to get?" will spawn lots of differing opinions!

Good luck
Dan

I don't believe that you will be able to receive SSB with the R390A as is.
The BFO is for CW and wasn't designed for SSB. There is a companion SSB
unit that takes the IF output of the 390 and allows for USB/LSB RX.
I don't remember the model number of the unit. I had a 390A and the SSB
unit, but sold them 2 years ago at a ham fest.

cheers

Rick

>KQ6WQ

Be aware that for CW operation the Scout makes a jump in frequency every so often both on transmit and receive. It has an LC type VFO that is corrected for drift in jumps by a frequency sensing microprocessor. I can usually tell when I am working a scout although it in now way makes copy a problem. The jump on SSB is also there but not noticeable.

4148. Re: Best Dual Band HT

From: yantach@banet.net
Message-ID: <35fb66b4.0@news1.ibm.net>
Source record: 132134

Just to add my two cents:

There is also a feature called "dual in-band receive." It allows you to receive not only on VHF/UHF at the same time, but you can also receive on VHF/VHF and UHF/UHF. I know Kenwood's full dual band radios do it, and I believe that some other brands do also, but I have found that quite a few models don't. (The Alinco DJ-580 and DJ-582.) It may or may not be of much interest to you, but I find myself using it frequently. (Ie. Listening to my club's repeater and the local police frequency.) It may be something to look into.

On a personal note, I have owned the Kenwood TH-78A and TH-79A (the latter because the 78 was stolen.) In my opinion, the 78 was a better radio (had a few extra useful functions and 800MHz mod on SOME models), but both are great radios. Kenwood has a reputation for picking up a little more intermod than others, but I haven't found it to be much of a problem in my area. Currently, I use a Kenwood TH-79A and a TM-733A mobile rig. I'm very happy with them both.

I've had some exposure to the Alincos, and they are good radios (and cheaper, might I add), but lack some of the other bells and whistles (like dual in-band recieve).

Hope this helps. If you have any questions, please e-mail me.

Hi Bob...I am just an Individual....but sort of a dealer....I buy and sell
and restore mostly antique radios...but being a Ham for 40 years...I
also do a little with old Ham Equipment....so I guess I am not a
"Business" as such...but I certainly don't want any bad advertisement
or bad feedback on E-Bay or on the newsgroups....guess thats my ...02
worth for today...

Hello all I have a Yaesu FT-5100 Dual band 2m/70cm with mars freqs.
also has RX/TX crossband operation in excellent shape used as base
station a 9++ radio 50w VHF and 35w UHF has original quick disconnect
mobile bracket and hardware,DTMF mic,box and manual.

325.00 shipped US postal M.O. prepaid

Also a Comet GP-6 2m/70cm Dualband Base antenna excellent antenna
very clean works well 100.00 local pickup NW Chicago,IL.
Will ship at buyers expense??

Will consider trades on Motorola Syntor X9000 UHF 450-470 mhz
must be complete 110w unit, or 28-54mhz Syntor X9000 same complete!

Please send all inquires to e-mail below thanks...sk

Hello Gore. The radio is "diode programmable. In other words; you need a
copy of the program diode layout. If you look at the program board, you may
be able to figure it out. It is marked on the board what each diode place
does.

4156. Collins R-390A/URR Technical Manuals

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-12 00:00:00 UTC
From: "Paul, KC2DLA" <kpaul@usa.net>
Message-ID: <01bdde62$917a13e0$13a6accf@bert.poss.com>
Source record: 132170
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.scanner,rec.radio.swap

Could some one please tell me where I can find the Technical manuals for a Collins R-390A/URR? I am new to Amateur Radio with a tech license, but use the radio to listen on HF. I can recieve AM and CW just fine, but I think the internal BFO pitch is off because I cannot get SSB. I have tried tuning in on the KHz knob while adjusting the pitch, but I still cannot get a clear voice at all. I am prepared to purchase a copy or authentic manual for the radio, but if someone could tell me where the internal adjustment is I would really appreciate it! Thanks.

I just bought a brand new used Kenwood TS-700A 2m all-mode rig,
and the manual hasn't arrived yet. I am totally unfamiliar with
operating any SSB, let alone this rig, but was thinking I'd
really like to try to participate in the VHF QSO Party this
weekend. (This would also be my first contest.)

Can anyone give me any instruction on the workings of this
particular transceiver?

Any contesting advice is appreciated, too. I have a little
horiz pol yagi, about 20-30 feet off the ground.

Thanks!

73,

4162. Help needed for Heathkit SB-200 linear.

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-12 00:00:00 UTC
From: morinm@csdgs.qc.ca
Message-ID: <6tebk7$v5n$1@nnrp1.dejanews.com>
Source record: 132176

Hi there I've got a problem with a Heathkit SB-200 linear, it gets out less power than I put in it. I opened it, checked everything, nothing is burnt or broken. The tubes light and glow a bright orange when I transmit. When I put 100 watts in it, I get between 80 and 130 watts out with a perfectly resonant dipole on 3.790 mhz. I took some electrical readings which I post below, maybe someone can put some sense into this. The tubes are 2 Raytheon 572B in parallel.

While in receive only, transmit relay off:
Plate voltage is 2400 volts.
Plate current is 0 ma.
Grid voltage is -134 volts.
Grid current is 0.

With transmit relay on, no signal in:
Plate voltage drops to 2350 volts.
Plate current is 80 ma.
Grid bias is -134 volts.
Grid current is 0 ma.

With transmit relay ON, 100 watts input:
Plate voltage drops to 1950 volts.
Plate current is 700 ma. A little too high.
Grid bias is -2.2 volts, quite normal.
Grid current is 60 ma, I think it's too low.
Power output varies between 80 and 130 watts depending on the temperature of the tubes. I checked with 2 different wattmeters.
The tubes glow a bright orange but one more than the other.

If anyone can make sense out of this, please reply be email or post your comments here. If anyone wants it for $200.U.S. shipping and insurance included to your QTH, just drop me an email. Thanks for any answers and take care.

Exactly what do you wish to modify to gain/lose? You could take your hot iron and make a number of holes in the plastic front panel. Then, pour pasta from the boiling pot into the top of the rig! WOW! you've mod'ed the rig into a dandy pasta strainer!!

Like you, I have read references to this magical powder in various mobile manuals, but never found any, or seen an explanation of how you would introduce it into a tire! But you can try this:

Have the tire and wheel dismounted at a tire store. Remove the valve stem and allow the tire to deflate. Now you can squeeze in some powered graphite thru the hole left by the removal of the valve stem.. Replace the stem, reinflate, and your done.

One person's opinion: They are noisey, and do not respond well to the wide fluctions in current demand presented by typical ham use, i.e., rx(low current) to tx(high current). I know that the small size and light weight is appealing, but it is my OPINION that the switchers are better suited to situations of constant current demand.

I bought the Ten Tec switching supply ($90) meant to go with the Scout. I use it with my TS50 (at the 50 watt level of course) and it works great. I can't tell the difference between it and my 20 amp Astron (except of course I can run a 100 watts with this supply). On the air reports are fine. I use it while traveling (weighs 3 pounds) and no hash in the receiver even when the antenna is in the motel room with me. (why didn't I buy a Scout? I tried but at the time Ten Tec couldn't deliver for a month and my local candy store had a sale on TS50's ($830). This was in 1994 and the Scout with all its add ons (band plug ins, mike, NB ect.) came to about $700 so it may have been a better buy anyway.)

Does the Icom 746 support crossband operation (transmitting on one band and receiving on the other)? I can't see such functionality mentioned anywhere in their literature. (I don't own one--I'm still trying to make up my mind about getting one.) It's a feature that I'd want for satellite operation.

(Please respond directly to me at david@jaffeNO_SPAM.com, but first remove the NO_SPAM)

About the only decent resources in print are the Tucker Electronics
catalog (http://www.tucker.com) and, for Tek scopes in particular, Stan
Griffiths' "Selecting and Restoring a Classic," at
http://www.amazon.com/exec/obidos/ISBN=0963307150.

The definitive online "Tektronix Museum" can also be found at
http://margo.student.utwente.nl/~wel/tek.htm#Oscilloscopes.

I'm looking for info on the Bearcat DX1000 shortwave radio.
I believe it was the only shortwave radio sold under the
Bearcat name.

Looking mainly for service manual or schematic buy any info
a help.

Someone who original worked for Bearcat Electric responded
to someone elses quest for help. I would appreciate it if
I could ask you some questions.

I don't own the Alinco DR-140T, but I do own several other Alinco Radios.
I consider ALL of my Alinco equipment to be very good and I've never
had any problems with any of their equipment. So, over all I'd give any
Alinco equipment a "thumbs-up".

You may want to consider the Ten-Tec Scout. When I upgraded to Tech Plus I purchased the Scout with the 10 meter band module and the hand held mike for around $600. Later, when I upgraded to General (then Advanced) I purchased the 40, 20, and 15 meter modules for under $100.

The Scout is a solid, easy to use, basic HF rig. My transmitted audio reports always come back as very good. The received audio is also very good. While the power output of the Scout is 50 watts, that's just 1/2 an "S" unit less than 100 watts. If you do a search via Deja-News, you'll find lots of past postings from other Scout owners who give the Scout a "thumbs-up".

The Scout uses Band modules to select the different bands. Each module costs $29 (plus shipping). If you must have every HF Band, the price will be close to the Alinco DX-70T. Also, even with all the Band Modules, the Scoud does not receive every HF frequency. (That's not a big deal to me, but to other Hams, that may be a big deal.)

Also, the Scout only operates in SSB and CW modes. If you must run in AM or FM mode, consider another rig.

The Scout is exactly what I wanted in my first HF rig. It doesn't have any fancy features, but it's VERY easy to operate. If I ever decide to upgrade to a "bigger" rig in the future, I sure won't sell my Scout! The small size of the Scout makes it ideal for putting it in my car. :-)

73,
Bob

My 741 2 meter module did not have any grease, the substrate cracked,the other modules, 6 Meter and 440 mhz HAD heat grease.
I jumped the traces with solder, GREASED the PA module, and it has worked ever since.
(With a bit lower [35 Watts] output power.)
However, I did have a power lead desolder from the 6 Meter module PA. (NO output)
Kenwood, used a solder bridge to connect the power pin perpendicular to the board!
I added a copper perforated strip to BOND it to the board. Worked ever since!

4188. Hamfests - What do you expect from a seller?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-12 00:00:00 UTC
From: kb9rha@my-dejanews.com
Message-ID: <6teq89fbq1@nnrp1.dejanews.com>
Source record: 132202

I have been reading a lot of messages lately regarding hamfests. I like to get a table every year at Radio Expo in Grayslake, IL.

http://www.chicagofmclub.org for Hamfest Information.

Anyways, I would like to find out the following info:

BUYERS:
1. Do you expect a guarantee or warranty? Would you like to have a way to contact the seller in case of any problems?

2. Do you expect a seller to be ready to demonstrate equipment?

3. Do you expect the seller to have taken the effort to setup his table attractively and have everything looking clean and ready to sell?

4. Please list any other expectations you may have.

SELLERS:
1. Do you take any measures to prevent theft? If so, what are they?

2. What kind of guarantees, if any, do you offer your buyers?

3. Please tell about anything else you may do to increase your success at hamfests.

Please send your replies to zman@iwc.net. I would like to take the info and write a report on it. The report will be placed on a website for all to view.

Contributors will be listed unless they state otherwise in their replies.

Thank you,
Christopher Zeman, KB9RHA

> a mistake.

In the "Members Only" section of the ARRL WEB pages, the SG-2020 had good transmitted audio, but the received audio was not so good. The rig tries to over come the limited power by heavy processing of the audio. I think that this review might appear in the next issue of QST.

Over all, I got the impression from the ARRL review that the SG-20 might be OK as a "QRP" rig or a portable rig, but I get the feeling you won't want it as a first rig.

WHY I PURCHASED THE TEN-TEC SCOUT:

When I upgraged to Tech Plus, I considered several low-end rigs and chose the Ten-Tec Scout. A Scout with the 10 meter Band Module and a hand held mike sells for about $600 >>> NEW <<< !!!

First of all, the Scout does have some limits: (1) You must purchase band modules for each HF Band you wish to operate in. (2) It doesn't do AM or FM modes. (3) Even with all the Band Modules, the rig does not receive every HF frequency.

HOWEVER; The Scout is one solid "little" rig. If you do a search using Deja-News, you'll find lots of posting from Hams who love their Scout. I find that the Scout is VERY easy to use. As far as performance, it performs very well. The contacts I've made using my Scout always give me "very good" as far as audio quality. As far as receive, when my friend brought over his rig and we compaired the 2, I felt that my rig did a little better than my friend's more expensive rig. (OK, maybe I'm biased toward the Scout.)

In my case, when I upgraded to General and later to Advanced, all I needed to do was just purchase 3 more Band Modules at $29 each (plus shipping). Now I operate on: 40, 20, 15, and 10 meters.

If I deceide to "upgrade" to a bigger rig, I sure won't sell my Scout!!! My car has a nice spot where I'll move the Scout to. :-)

CUTS FROM THE ARRL REVIEW:

What SGC delivers in the SG-2020 is an impressive-looking SSB/CW transceiver that, for starters, looks much more like ham gear than did its Index ancestor. The radio is a bit smaller
than an ICOM IC-706 or a Kenwood TS-50S, and there's a nice big tuning knob, several rubberized pushbuttons, RF and VOLUME knobs, an LCD display, and a surprising number of features for a radio at this price.

In terms of all-band HF amateur transceivers, the SG-2020--for now at least--represents the lowest end of the price scale. You'd have to spend at least another $200 or so to find the closest market "peer" to this radio.

What you get for your money is really quite a bit--a relatively low-power (but not strictly QRP-level) CW and SSB transceiver (also capable of data modes) in a very attractive package that's suitable for home, mobile, or portable use. There's a 2.7 kHz crystal filter. A
switched-capacitance audio filter (SCAF) performs all additional filtering, providing bandwidths from 100 Hz to 2.7 kHz in 100 Hz steps. In addition, it has 20 memories; a built-in CW keyer; a noise blanker; RIT, XIT, and split capability; variable passband tuning;
an RF gain control; and an LED bar graph S/power-output meter that can be set for peak reading.

<snip>

Hey, that sounds darn good for only 20 W!" That was the most frequently heard report on SSB and sometimes on CW. We also found
that 20 W is plenty of power to work the world--even with a modest antenna.

The unit's audio processing circuit is always on, and there's no mike gain control. Instead, the SG-2020 uses a voice-operated
gain-adjusted device (VOGAD) to automatically set the correct level. The resulting transmit audio is very good and does not sound overly processed. The radio has decent CW keying, but when using the built-in iambic keyer, it's not full-break-in (QSK). The CW pitch (offset) is fixed at 650 Hz. Kudos to SGC for including separate hand key and paddle jacks.

I found myself wishing that received signals could be as clean and unruffled as the transmitted ones. The receiver is pretty sensitive (see Lab Data), but, frankly, I was disappointed by the radio's signal-handling capability. Nearby signals--even if they're not terribly strong--can render on-channel copy difficult or impossible. You can effect some improvement, especially on stronger signals, by backing off the RF control, but audio-derived AGC does not willingly pick up the slack for weaker signals, and you can't vary the attack time.

<snip>

I never quite got used to the way the radio sounded when tuning through a band. It sounds raspy and noisy, and it impairs your ability to pick out weaker signals when you're just trolling. If the band is active, you'll hear a lot of trash too. As you can hear, once you're on target, the audio is passable.

<snip>

Credit goes to SGC for paying attention and responding to user comments and complaints. The company has posted an "important information update" section on its Web site at

http://www.sgcworld.com/products/SG2020/2020update.htm

that responds to issues users have raised.

For an economical, compact transceiver, the SG-2020 is a nice start. But I'd like to think that SGC could develop this product into one that works every bit as good as it looks. In this price range, however, this could be as good as it gets.

Manufacturer: SGC Inc, 13737 SE 26th St, Bellevue, WA 98005; tel 425-746-6310; e-mail sgc@sgcworld.com;

http://www.sgcworld.com.

Manufacturer's suggested retail price: $625.

4192. Re: switch mode supplies for amateur use

On 12 Sep 1998 08:46:42 GMT, hamish@moffatt.nu (Hamish Moffatt) wrote:
>Are switch mode supplies any good or any problem for use
>with amateur transceivers?

Some switchers are fine, some aren't. Switchers are light, compact,
and efficient, but there can be some problems if they aren't designed
for radio use.

Some switchers won't maintain regulation at very light loads.
This can be a problem for transceivers and SSB transmitters.

Some switchers lose regulation when exposed to RF fields.
This can be a problem when used with any transmitter, or
near any transmitter. This latter should be a caution to
those with computers near their high power transmitters.

Some switchers go to extremely high output voltage when they
lose regulation, spiking to 200 to 300 volts. This can be deadly
to solid state equipment.

Some switchers generate high frequency hash which is inadequately
shielded and filtered. You can generally fix this, but it is a pain.

And all switchers are a pain in the butt to troubleshoot and repair.
Because of the complex feedback used in switchers, and the
sometimes byzantine protection circuitry, it is often necessary
to use heroic measures to troubleshoot them.

>Has anyone bought one from one of the industrial power supply
>manufacturers and would like to make any recommendations?

I've had some very bad experiences with switching supplies,
but in fairness I have a lot of equipment which uses them
without problems. Lambda supplies have caused us the most
grief. In one case we replaced the supply in frustration with a
diesel truck battery and a float charger after Lambda was unable
to resolve the problem of repeated failures (never twice the same
failure). They refused to keep replacing them under warranty, and
it was taking on average over 20 hours of tech time to troubleshoot
and repair them after they failed (overly complex pieces of crap).
This was a basic 12 VDC 50 amp supply for the low level stages
in a Harris broadcast transmitter. We've also gone round and round
with Sony switching supplies used in their broadcast gear. The
supplies are generally reliable, but when they do fail they are the
worst things to troubleshoot and repair. But we've had good
experience with supplies by AC-DC Electronics. They've shown
good reliability, and are relatively easy to fix when they do fail.

We haven't used them in very high RF environments, however,
so I can't give them a blanket thumbs up.

In the amateur realm, Astron and Samlex are offering switching
supplies which seem to have addressed the common concerns
about using switchers with radio equipment. They handle varying
loads well, seem to be well shielded against RFI, both in and out,
fail benign (AFAIK), and are relatively easy to troubleshoot and
repair.

But I must say that I'm sticking with conventional transformer,
rectifier, regulator analog supplies for my amateur equipment.
They are a dead simple brute force approach which rarely causes
any problems (though they can lose regulation too under high RF
fields if not properly bypassed), and are dead simple to troubleshoot
and repair when they do fail. The only thing simpler is a battery
and float charger.

Before you ship it away for $200, check the wafer of the bandswitch that
switches in additional sections of the variable loading capacitor for
the lower frequecny bands. It sound like you have insufficient loading
capacity the 3.5 MHz band.

Either the switch contacts are burned off, or mechanically damaged so
they are not making contact.

Hope this helps.

Most tire manufacturers include graphite in the compound mix when making tires today, so tire static is mostly a thing of the past. If you use the cheap nylon bias ply tires still available for trucks, you can have some problems with tire static (as well as with flat spots every morning, bump, bump, bump). So don't do that.

Most cases of static problems today can be traced to improperly fitted or missing static caps on the wheel bearings. You can always do what the old timers did and drag an anti-static strap or chain from the axle. (Hey, it worked for Standard Oil, and look how rich they are.) But a careful check of the anti-static caps should usually fix the problem.

A thin piece of teflon sheet would probably be better. Any excess spacing
of the mount body from the auto body will reduce the capacitance between
them, and that capacitance is necessary to counterpoise the antenna. If
you do have to use a spacer, use as thin a spacer as possible, and use
one with a high dielectric constant. Teflon sheet fills the bill. Usually,
however, a good coat of carnuba wax on the car and on the bottom of
the mount will prevent scratching of the paint. Just make sure the surfaces
are clean before setting the mount on the roof, then leave it alone.

Short of collecting catalogs from all the suppliers, I'd suggest that you get a Tucker catalog. They're in Texas (near Dallas/FTW, as I recall). They sell a lot of used stuff and may be of some help to you.

It may/probably will, to some extent. I believe that antenna is set up to have a certain cap. between the base and the car (ground plane). If you change the spacing, you'll change the capacitance. To what extent, you'll have to try and see.

> I bought some NEXCells for my portable gear, but no charging
> instructions came with. No help on Maha's WEB site. Can anyone help?

There's a wealth of information on the Maha site on NiMH cells...including the best charger available for NiCDs and NiMH cells for under three hundred bucks.

The Maha MH-C777a Universal Conditioner/Charger will properly charge packs from 4.8V to 12V. Conditions 'em, too! All for fifty bucks.

Chargers for NiMH cells need to be more complex that those for NiCds - because the NiMH does not generate an adequate voltage drop at full charge to utilize the Negative Delta method.

So - for best cell life, the NiMH should be quick-charged in a charger that recognizes them as NiMH cells.

Hi John!
If your computer specs specified that it can be powered from a car 12 volts system you should know that such a system provide in reality 14.2 volts dc when the engine is running, so you now only need to drop you battery pack .8 volts so a good diode will do the job. And if you want to use a three pin voltage regulator don't forget that there is about 2 or 3 volts absorbed by the regulator himself between the input and output so the 15 volts source will become 3 volts down say 12 v. when the battery is fully charged.
Good luck !

Mike,

My 706-MK2 needs alot of wire as a BCB antenna to function OK. I use a 100 foot longwire and am able to hear alot of DX BCB stations. When I first got the 706, I used a 40 meter dipole and could not hear 50 kw stations that were 20 miles away. Put up the longest wire that you possibly can.

Good luck,

Jim...

> That's true around Atlanta, and it is also true up at my farm in
> rural Kentucky.

I often run out of cell range -- but have yet to run into a location where I couldn't hit at least 2 2m repeaters. I live in Western NC -- Appalachian Mountains.

> > o Infratructure susceptible to damage.
>
> Sure, but not as much so as the average amateur repeater.
> Cell sites are built to rigid commercial specifications, amateur
> repeaters often are not.

Any infrastructure relying on remote towers is susceptable to damage. However, with my 2m rig, I then have simplex communications at my disposal when the repeater goes down, whereas, with a cell phone, I have a useless duplex radio that requires a cell site for any communication. In my area there are several hams who are just about constantly monitoring 146.52 between them. With 70 watts mobile on a hill, I can talk quite a ways.

We are very fortunate here: both of the wide area repeaters I use from my house are commercial grade and on high-strength towers. One, 147.135 -- Brevard, NC, is on a UHF television tower at 1540 feet above ground. Since it is colocated with a major UHF TV station, a megawatt generator and the TV station's engineer are at its disposal.

I haven't even started to talk about HF....

Right! That's what they normally consider a loss-leader. I can't believe that wouldn't already be accounted for in their prices. If I'm asked to pay for the 1999 catalog, I'll probably do so, but not without protest. I'll bitch and moan on the local repeaters and so forth. That's ridiculous.

Aren't ALL auctions? The whole concept is a bunch of people competing
to see who can pay the MOST for an item. It would be silly to expect a
LOW price from an auction.

For some folks, Ebay prices are a bargain and
a chance to find sets they may otherwise never
run across. There are some isolated areas where
one doesn't have the opportunity to attend shows or
auctions to find this stuff. I have found a few radios
(well, one anyways) that I had been searching for,
and got it at the going market rate.

The trick is to set a price in your mind, bid it,
stick to it, and hope for the best.

Pete

SF Bay Area ??? are you Trolling ??? E-Bay has listings from
individuals all over the US and other parts of the world, they've
also just been named to officially take over AOL's classified
ads/buying/selling. As I mentioned earlier E-Bay _Doesn't_ sell
anything _Themselves_ , and they _DON'T_ set the prices, they merely
get a brokerage or percentage of the item's worth when it's sold as do
most _true_ auctioneers. I suspect it's folks ego's that cause such
high prices to be paid but you sure can't blame E-Bay for folks that
bid _more_ for items than you can buy them new for.

4226. switch mode supplies for amateur use

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-12 00:00:00 UTC
From: hamish@moffatt.nu
Message-ID: <6tdcdi$e4t$1@emu.cs.rmit.edu.au>
Source record: 132293

Are switch mode supplies any good or any problem for use
with amateur transceivers?

Has anyone bought one from one of the industrial power supply
manufacturers and would like to make any recommendations?

thanks

Hamish VK3TYD

>Brian KB7OIE

Buying at a hamfest is an art. If the equipment looks good, is priced near fair market value, and the seller isn't too anxious to unload it on you, then it is probably Ok. Look at what else he is selling, observe his demeanor, check the equipment over carefully, if the hamfest has a test bench, use it, etc. For a big ticket item, ask for a guarantee from the seller. If he won't offer one, walk away or make a much lower offer for the equipment.

Some sellers at hamfests are regulars who show up year after year. If you go to many hamfests, you'll learn who these fellows are, and what reputation they've earned. You can feel pretty confident about buying from those who've earned a good reputation, and should be very leery of those who haven't got such a good reputation.

The best buys at a hamfest usually occur as it is closing, but that doesn't give you a chance to test the equipment and get back to the seller. Realize your risks grow with the lateness of the hour. It may be worthwhile to pay a bit more and buy early. That gives you a chance to find the seller and get satisfaction if the equipment doesn't live up to your expectations. But if you're a gambler, you can get some great deals from those packing up to go home.

Lack of the proper manuals always calls for a sharp discount. I don't care about the original cardboard shipping box, but some amateurs do. I'm more concerned that the accessories are present, IE power cords, mic, the odd little accessory plugs, mobile bracket if applicable, etc. Those things can be hard to find for an older radio. Also be aware that stolen equipment sometimes shows up at hamfests. A radio without the usual manuals and accessories, and priced too low for its condition, may be hot. But these things can also just be lost, especially for older radios, so you shouldn't worry over much about them.

When looking over the equipment, look for obvious signs of abuse. If the screw heads are marred, the unit smells of burnt components, has obvious dents, etc, then it has probably led a rough life. Ordinary

wear and tear should be expected with used equipment. That may mean that the owner has gotten a lot of use and enjoyment out of the rig, so it might be a pretty good radio. Be somewhat cautious about radios that look showroom new. There may be a reason the owner is getting rid of it that you won't like. If the radio looks *too* good, I tend to tread very softly.

Familiarize yourself *ahead of time* with the sorts of equipment you might consider buying. The ARRL has a book (don't they always) listing the most common amateur radios. Get to know the models that interest you. Find out about known problems and quirks. Determine what the fair market value of the equipment is. Any radio being offered well below the fair market value probably has problems.

There's nothing wrong with buying a "fixer upper" but go into that with your eyes open. I generally figure a fixer upper should be a couple hundred dollars below fair market value. That should cover a trip in for factory service if you don't want to fix the problems yourself (unless it has been zapped by lightning and is total silicon scrap). Be aware of which radios still have factory support. Some use parts which are no longer available. Unless you know for a fact ways to work around that problem, avoid those radios even if they are working.

Now buying boatanchors is a different thing. Expect problems, and don't worry too much about them. Every boatanchor should be considered a fixer upper. I wouldn't buy one that looked pristine. Most of the fun of owning these antiques is in the restoration.

I've bought a lot of used equipment at hamfests. Most of it has been good, some needed a bit of work, only a couple of times have I gotten a hopeless case. Those get consigned to the parts bin. Few items are a total loss, the components are worth something.

ADI has been asking hams what they'd want in an under $500 HF radio.
No announced products yet, however.

4233. Re: Need Help IC-2SAT

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-12 00:00:00 UTC
From: Rudy Marcelletti <rudym@net-link.net>
Message-ID: <6tdnfa$e6n$1@leol.net-link.net>
Source record: 132300

Periphex as well as several others who advertise in QST sell replacement batter packs for most rebuildable packs like Icom. I have done 3 so far--a BP-3 for my IC-2at and 2 BP 7's for my IC-32at. The replacement packs generally have a higher capacity than the factory guts--I think about 100 ma or so. Periphex will even rebuild some packs, like the BP-7, and just about double the capacity, but the voltage is lowered somewhat. If you can, opt for Nickle Metal Hydride replacements rather that Nickle Cadmium.
Also, you may get lucky and find a complete pack on sale about the same price as the guts elsewhere, so call around. The replacement packs usually come all glued and taped together with wires all set to solder into your old pack.

My 706mkii does the same--runs warm. even in a 67 degree F basement. I don't pay any attention to it and now that I have the head separated and the main unit under the truck seat--I don't even hear the fan.

How do they get around the registration part in order to bid? I just got burned on a telephone to the tune of $25.00. I was high bidder and sent my money order but never received the phone. E-bay had no valid address and the phone was disconnected. I have also been burned on other items..I bought a computer with 17" monitor and the monitor crapped out after two days. The seller said I must have changed something and would not make good. I have had others, but those were the worst. I would say 70% good and 30% bad. I have bought items very cheap and sold items very high (much to my suprise) so I guess it is a crap shoot. A lot of people actually run their businesses on E-bay. I wish there was a way to tell who is a private party selling an item and who is a business. I think that makes a difference.

My .02

Folks,
Here's an odd question for this newsgroup.... :-)

Has anyone looked into Ham Radio license plates that are also commercial
license plates in New York State?

I'm buying a pickup that I need to register as Commercial but I'd like
to put Ham Radio plates on it. I'll also call DMV but given my experience, I
suspect I'll get better quality info here ;-)

I am having a problem eliminating noise from my 32 Ft Motor home. Its a diesel engine. No ignition noise of course but a rasping or popping noise appears at highway speeds that seems stronger on rough roads. I have been trying to locate an anti static powder to inject in the tires to eliminate road static which is about an S7 level in my ICOM706. Any info appreciated.

Message-ID: <35fdc779.510085793@netnews.worldnet.att.net>
Source record: 132064

I received mine at no additional cost, also.

It seems that if your name is already in the *store's* database the
system will default to a 'no-charge' status for the catalogue.

The sales clerk tried three or four times to change the price to
'0.00' before noticing it was the default for that item :)

For several years the catalogue was considered inventory and the
stores were charged for them. Each catalogue they sold recovered the
store's cost of the item, but without a great profit. Many stores,
including the store I was employed in for over five years (I am a
veteran of almost twenty years with RS - no longer with the company)
decided to take the loss and distribute the catalogues at no charge.

Because they were inventory, though, the item had to be recorded
through the POS to avoid adding to a possible inventory-loss.

4249. FT-920 Receive Signals Distorted on 6 meters?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-13 00:00:00 UTC
From: Randy Perkins <ranperk@ghg.net>
Message-ID: <35fbcd2d.0@news.ghgcorp.com>
Source record: 132065

Just got the Yaesu FT-920, all seems to be great except notice on 6meters some receive (Mostly Strong) signals seem distorted and I can heard them across the band very distorted. This seems to be worse with the noise blanker on. Has anyone else noticed this? And is this a defect with the radio or possibly because I am using a poor antenna on 6 meters (40 meter inverted V). All the HF bands seem normal. Any ideas?

Thanks,
Randy, WB5KCM..

4250. Info on Yaesu FT-102

I have to agreee with u Mark,Name is Dennis and the call is WY3F.When I first
started out I owned a Alinco DJ-580 (great rig with 800 rx).
A friend of mine bought a Kenwood TH-78a and I fell in love with his that I
bought one also.
That was 5-6 yrs ago,and I still use it and enjoy all the features.
dual in band rx vhf/vhf or uhf/uhf or vhf/uhf.
I have the opt. memory chip in my 78,so that i can use the alpha numeric display
for more than 25
freqs in that mode.
With that chip it will do 250 memories i think.
I always use mine in alpha numeric and i think it will do 150 memories with the
chip in.
Other things I think that set the TH-78a apart from the rest is that it has a

built in clock,and timers.
I used this rig as a alarm clock while camping one time,U can set it to come on at a certian time
or go off at a certian time.
After extended rx/tx mod u can use the rig as a cross band repeater, or clone it with a nother th-78a,
It works ,that is how i gave my friend all the freqs that I had in mine after he done his tx/rx mod.
There is also a game that can be played on the th-78a it is like simon.
Getting back to the rig I think that the th-79a is a good rig but lacks some things that the -78a had.
On the th-79a there is a on board instruction /where on the 78 there is nothing like that .
If I did'nt have my th-78 and I was looking to buy a new ht I would take a good look at
the Kenwood th-79a,and the Icom IC-W32a,and the Yaesu FT-51r.
One thing that I am slowly working on is to be able to program my th-78a via software.
That is the only thing it lacks compared to the rigs of today.
I must agree with Mark I think the TH-78a is the best dual bander that I have ever owned and
seen on the market,and I plan on holding on to mine,since then my friend sold his th-78 and picked up
a yaesu ft-50 and to me the way he talks ,I think he wishes he would have not sold his th-78a.
He loves the ft-50,but he cant rx 2 freqs on the same band at the same time,but he likes that it can
be programed via a pc.
My other Friend owns a ft-51r and that will do the dual in band rx,and can be programed via pc.
In my opinion is that I will never own a dual band rig that wont do the dual in band rx.
Mobile or portable.
Just adding my 2 cents about my experiences with the th-78a.
Good luck looking for the best dual band ht.
If u need any info on the th-78 dont hesitate to ask me .

RFI noise in Ford vehicles

After installing an HF rig in my 97 Ford Explorer, I was disheartened
to discovea S9+ noise level. The source appears to be the electric
fuel pump. I received some excellent info from other Ford owners and
I now wish to pass along some of that advice here.

Ref: Ford Technical Service Bulletin: 98-7-3
"Fuel system - fuel pump: whining/buzzing noise comes thru 2-way
radio speakers"

Vehicles covered:

Ford
1990-93 Tempo
1990-97 Probe, Thunderbird
1990-98 Escort, Taurus
1990-99 Crown Victoria, Mustang
1997-98 Contour

Lincoln-Mercury
1990-92 Mark VII
1990-93 Topaz
1990-96 Continental
1990-97 Cougar
1990-98 Sable, Town Car
1990-99 Grand Marquis
1991-98 Tracer
1997-98 Mystique

1997-98 Mark VIII

Light Truck
1990 Bronco II
1990-96 Bronco
1990-97 Aerostar, F Super Duty, F-250 HD, F-350
1990-98 Econoline
1990-99 F-150, F-250 LD, Ranger
1991-98 Explorer
1993-98 Villager
1997-98 Expedition, Mountaineer, Windstar
1998 Navigator

The Problem:
Electrical noise on radio speakers caused by in-tank electric
fuel pump.

The Fix:
Installaition of an RFI filter (Part No. F1PZ-18B925-A) on the
fuel pump inside the fuel tank. *Note: some light trucks may require
one RFI on each fuel pump on multi-tank vehicles.

Test Procedure:
Fuel pump radio noise is relatively constant and changes only slightly
with vehicle speed. If the frequency of the noise varies, or the noise
comes and goes with vehicle speed, then it is NOT the fuel pump, and
this fix will not be effective. Use the following procedure to determine
if the fuel pumpis the cause of the radio noise.

1. Turn the radio on.
2. Turn the ignition key to the RUN position, but do NOT start the engine.
3. The fuel pump should run for about 1 second with the key in the RUN
position with the engine not running. Listen for noise in the radio.
If the noise is present while the pump is running, and stops when the
pump stops, then the noise is being generated by the pump and this
procedure should help.

Additional comments:
I purchased by own vehicle "used" from a Ford dealer and also purchased
the extended service plan. However, the service manager told me that this
repair would be done under the BASIC WARRANTY and not by the extended
service plan. For what it's worth, the RFI part costs about $70 and
sometimes takes a week or so to be delivered to the dealership. Other
Ford owners have also told me that this fix was done at no charge to
them as well. So.... if you've got a problem ... perhaps this will help.

Warmest 73,
Sandy W7BX
slay@netcom.com

PS: I did have the filter installed on my '97 Explorer and noticed an
immediate and substantial improvement on 15m; with the use of my noise
blanker, the noise dropped to <S1. On 20m, however, there is still

some substantial noise and I have been advised to properly ground the antenna to the chassis of the vehicle. For what it's worth, my first QSO was with JA3CZY on 15m ... so, I guess it works.

For these and other reasons I have authored my own proposal that addresses these issues. I will be submitting this as my "comments" to the FCC on its NPRM. There are some controversial ideas here but I hope that many hams will find something in here they like as an alternative to the ARRL and FCC proposals, both of which are not really what is needed.

RE: NOTICE OF PROPOSED RULE MAKING

TABLE OF CONTENTS

Paragraph

INTRODUCTION

SUMMARY

Authorï¿½s BACKGROUND

DISCUSSION
Number of license classes
Greater volunteer examiner opportunities
RACES Station Licenses

Privatization of Certain Enforcement Procedures
Telegraphy examination requirements
Written Examinations

CONCLUSION

I. INTRODUCTION

1. You, the FCC, are initiating this proceeding as part of your 1998 biennial review of regulations pursuant to Section 11 of the Communications Act of 1934, as amended. In conjunction with your biennial review of regulations I call your attention to the Communications Act of 1934, as amended, which requires to FCC to. expand the number of trained operators, technicians and electronic experts . In this respect the Commission now has an opportunity to take steps to meet this obligation. In doing so it may be necessary to enact rules and make changes that may not be popular with the existing amateur licensees. None the less, I recommend the enclosed comments to you in the hopes that in the long term the amateur service will grow in ranks and return to its roots in experimentation and advancing the state of the art.

II. SUMMARY

I propose that the Commission modify the Amateur Radio Service rules as follows:
ï¿½ Reduce the number of license ï¿½classesï¿½ from 6 to 4 as outlined below.
ï¿½ Retain only a five word per minute code test element for the proposed Class A entry level hf license
ï¿½ Delete the five word per minute code test element for the proposed Class A entry level hf license as soon as Article S25 is deleted from the WARC treaty.
ï¿½ Provide greater opportunities for more volunteer examiners (VEs) to participate in the examination process.
ï¿½ Eliminate Radio Amateur Civil Emergency Service (RACES) licenses because the emergency communications that routinely are transmitted by RACES stations can be transmitted by primary, club or military recreation stations, as proposed by the Commission.
ï¿½ Permit direct communications between Amateurs and public safety radio stations under certain conditions.

I suggest several ideas for improving your enforcement processes as they relate to amateur radio.

I also comment on changes to the telegraphy requirements for the amateur radio service and to the written examinations that must be passed to qualify for an amateur radio license.

I have also marked up the Part 97 regulations in the Appendix supplied with the NPRM to illustrate the license classes and privleges proposed herein. However, while I have tried to cover as many sections of Part 97 as may be affected by this proposed license structure, there are many other sections that will also neeed to be modified. In this attempt to show how this new structure may be implemented I have indicated deletions by strikethrough and additions in italics.

I am also suggesting that Part 97.21(4)c be eliminated. The Commissioni¿½s data basecontains the information needed to determine the proper status of any license for renewal purposes. The requirement for a photocopy is an unnessary burden on the applicant and creates additional costs for the government.

III. Authori¿½s BACKGROUND

The author holds an Advanced class Amateur radio operators license issued by the Commission. In addition, the author has been licensed as an amateur radio operator since 1959 and has seen many of the changes in amateur radio with regards to advancing technology, licensing changes, gains and losses in amateur spectrum, and is well informed on telecommunications issues. The author is an Electrical Engineer specializing in advanced network communications and computer systems. The author has taught amateur radio classes and has recieved a Public Service Award from the ARRL for emergency communications activities. The author received a BSEE degree from Carnegie Institute of Technology (now called Carnegie Mellon University) in 1966. The author is a life member of the ARRL, former president of the Waltham ARA, former member of the Los Cumbres ARA, a member of the West Valley ARA, and a member of Los Gatos ARES.. The opinions expressed in these comments are those of the author, and do not necessarily agree with the position of the ARRL or any of the above named organizations, with regard to these matters.

IV. Discussion
A. Number of License Classes
There are currently six classes of amateur operator licenses. In general, the higher the license class, the more expertise the licensee must demonstrate by examination and the greater the frequency privileges the amateur operator is authorized. However, the nature of the spectrum and the effect of international treaties, create a segmentation of the amateur radio service that suggests a license structure as follows:

Spectrum Segment Entry Level License Classes Full Privilege License Classes
Below 30 Mhz Class A Limited HF plus limited VHF privileges Class B Full HF privileges pluslimited VHF/UHF privileges
Above 30 Mhz Class C Limited VHF/UHF/SHF privileges Class D Full VHF/UHF/SHF privileges

The Amateur Radio Service rules are designed to provide emergency communications, advance radio technology, improve operator skills, enhance international goodwill, and expand the number of trained operators, technicians and electronic experts. In view of advanced communication techniques, this is an opportune time to consider additional ways to streamline and simplify the Amateur Radio Service Rules by conforming them to contemporary technological advances in the art of radio communication. Structuring the license classes in accordance with the spectrum associated with the class of operator and the communications technology that is applicable to that portion of the spectrum makes sense in view of todays treaty requirements and the state of the art.

There are presently six classes of operator licenses in the amateur radio services. Each time that an amateur operator moves to a higher class, the VEs must prepare and administer an examination, and the Commission must process a

license transaction to modify the data base and issue a license document. I agree with the Commission that there should be a number of license classes sufficient to encourage amateur operators to advance their skills in meaningful ways, and that six classes of operator licenses are unnecessary. Reducing the number of classes of operator licenses to the four suggested here will relieve the VEs from the tasks of preparing and administering unnecessary examinations. It would also ease the Commission's burden of providing oversight of the system and maintaining a data base of the current operator class for every amateur operator.

I have reviewed the various license classes and agree that there is an unnecessary overlap between the Novice, Technician and Technician Plus license classes. The Novice Class was established in 1951, at a time when telegraphy was still a common mode of radio communication in commercial, military, and marine services and applications. This is no longer true. Currently, there are very few individuals who take the examination for the Novice Class operator license. For example, in 1997, you received only 961 applications for the Novice Class. I assert that this is because the privileges available to the current Novice class operator are too restrictive to serve as an attractive entry level license to new amateurs in the HF spectrum. By comparison, you received 21,416 applications for the no-code Technician Class operator license. I agree with the commission that the no-code Technician Class operator license has replaced the Novice Class operator license as the entry-level license class of choice. Unlike the Commission, however, I conclude that the Novice Class operator license can serve as a useful entry level license by expanding the privileges to most, but not all, of the current general class operator in the h with the current holders of Novice Class operator licenses being grandfathered to the new Class A license proposed herein.. No new Novice Class licenses would be granted This will provide an attractive entry point into HF activity which was for many years the mainstay of the amateur service.

The disposition of the currently designated Novice bands is addressed in the privileges of the new Class A license. Essentially, the current novice segments become available to the holders of any Class A or Class B license. A asset of bandplan guidelines will be set forth below.

The only difference between the Technician and Technician Plus Classes is that a Technician Plus operator has passed a five words per minute (wpm) telegraphy examination while a Technician Class operator has not. Both Technician and Technician Plus Class licensees predominantly use FM voice and digital packet technologies on the amateur VHF and UHF bands. Yet, the VEs are burdened with preparing and administering telegraphy examinations, and the Commission is burdened with processing the resulting applications and revising the data base. I propose that the Technician and Technician Plus Class licenses be phased out and that all holders of the Technician and Technician Plus licenses be grandfathered into the new Class D license.. In addition, current holders of the Technician Plus license will be grandfathered into a Class A endorsement with the associated limited hf privileges.
Holders of a Technician Class operator license granted before March 21, 1987, have previously passed the written examination required to qualify for a General Class operator license and may ï¿½upgradeï¿½ to a Class A endorsement by

passing the code element for class A operators, as discussed below.

The holder of any class of Amateur Radio Operator license may ï¿½upgradeï¿½ by passing the required examination elements and having the licence endorsed with the added privleges. Thus the holder of both Class B and Class D privleges would have all the same privleges of todays Extra Class operator.

B. Greater Volunteer Examiner Opportunities
To expand the pool of volunteer examiners I propose that the holders of the new Class B license be authorized to administer Class A and B exams. Similarly, the holder of a Class D license may administer Class C and D exams.

C. RACES Station Licenses and Expanded Integration of the Amateur Service and the Public Safety Radio Services.
I agree with the phase out RACES station licenses by not renewing them and to continue the status quo by not issuing any new RACES station licenses. Noting that your rules permit any amateur station that has been properly registered with a civil defense organization to engage in RACES communications I propose that such stations also be authorized to communicate with public safety radio stations during times of emergencies or while conducting training exercises, subject to appropriate rules and safeguards.
The failure of cellphone and other communications services left large parts of the country dependent on amateur radio during recent mid-western floods and Eastern Florida fires, for example, clearly indicating a need to more closely integrate the amateur service with the public safety radio services on a local level. I urge the Commission to undertake a separate study of this matter in the near future and to invite comments on how this might be accomplished.
In my opinion, the existing restrictions on direct communications between amateur radio stations and public service stations are overly restrictive and not in the public interest. I suggest that amateurs who are registered with a local emergency services provider communicate in ï¿½cross-bandï¿½ mode with public safety services such as police, fire, etc. when authorized to do so by the local authorities. Each radio service will transmit on its assigned frequencies or within its assigned bands. On the amateur side monitoring the public service frequencies is relatively simple because many amateur transceivers have wide band receivers built in. The FCC should be careful that future regulations not reduce this capability in amateur equipment. On the public service side monitors may be needed to listen to the amateur frequencies. Many Emergency operation centers already have this capability. Cooperation between amateurs and public safety services on a local level will solve this equipment problem. This is certainly an issue that the bi-ennual review is intended to address.

D. Privatization of Certain Enforcement Procedures
I believe that there are sufficient laws and procedures in place to protect the amateur service and that the Commission can do more to enforce existing regulations. It is the duty of the FCC to enforce existing regulations in the amateur service and I urge the FCC to do so.

The FCC and the ARRL should form a task force for the purpose of determining the best way for the ARRL and the auxiliary service to be of assistance to the FCC in enforcement matters. However, delegating primary enforcement of radio regulations to a privatized agency, or, as in the case of the Citizens Radio

Service, delegating enforcement to local government agencies, are not acceptable to me and are not in the public interest. The regulation of radio transmissions are by their nature a Federal matter affecting public safety, national security, and international relations. This is not a matter to be delegated.

E. Telegraphy Examination Requirements

I propose to reduce the, three telegraphy examination elements to just one element, a five word per minute exam element for the Class A entry level HF license. In addition, I also propose that this requirement be eliminated immediately upon the removal of the requirements of Article S25, which includes the international amateur code requirement. This will substantially reduce the burden on the VECï¿½s and the Commission while complying with the requirements of Article S25.

In the early days of amateur radio, radiotelegraphy was the primary communication mode of all radio operators, including amateurs. Testing for knowledge of Morse code telegraphy was necessary to ensure that amateurs could recognize and stay away from Government and commercial stations as well as stay clear of maritime distress messages. This is no longer true.
In 1990, a codeless Technician Class operator license was established. In so doing, you stated that the amateur service should attract technically inclined persons. You also stated that we believed that telegraphers would be in less demand than electronics and communications experts. This has proved to be the case. Therefore, you provided an entry level opportunity to otherwise qualified persons who found that telegraphy was a barrier to pursuing the purposes of the amateur service. The success of the codeless Technician license is proof that Morse code is a significant barrier to amateur radio growth.

While these arguments justify the reduction of Morse code as an element of qualification for the amateur service the plan proposed by the FCC eliminates the only entry level license to HF operation and raises the bar on HF operation to the present level of 13 wpm. Effectively, The FCC proposal slams the door on expansion of the Amateur service below 30 Mhz. This is, I assume, an unintended consequence of the Commissions plan to reduce the number of license classes. It is not justifiable and is contrary to the mandate to provide for the growth of the service.

For these and other reasons I am proposing that an entry level Class A license with a 5 word per minute code element be established with limited privileges in the HF and VHF spectrum that are much more attractive than the existing Novice class.

The international Radio Regulations (Radio Regulations) that apply to the Amateur Radio Service require that all amateurs licensed to operate below 30 Mhz demonstrate their ability "to send correctly by hand and to receive correctly by ear, texts in Morse code signals." The Radio Regulations do not specify any particular speed. The five word per minute element proposed herein meets that requirement. Furthermore, the 1995 World Radio Communications Conference (WRC-95) resolved that Article S25, which includes the international

amateur code requirement, be considered at the 1999 WRC. Subsequently, this consideration was delayed to the WRC scheduled to be held in 2001. In anticipation of the high probability that S25 will be eliminated the new regulations resulting from this NPRM should provide for the elimination of the code element immediately on removal of Article S25

An ARRL has committee proposed that for all code examinations to specify one out of five minutes of copy for a passing score. The method of examining for Morse code proficiency, such as requiring fill-in-the-blank or copying one out of five minutes sent, instead of allowing VEs to determine how to test for code speed deserves some comment here. An objective quantifiable method is required to prevent bias and errors on behalf of any examiners. Furthermore, the use of a single scoring method, such as one minute of copy, has statistical possibilities that are unsatisfactory as a standard of performance.

For example: Correctly copying one minute out of five correctly, while missing all the characters sent in the other four minutes, produces a passing score of (5 words * 5 char/word)/ (5 min.*5 words*5 char/word) or
25 letters/125 letters equals 16% of the characters sent based on a 5 letter per word standard. At the other extreme a candidate who missed one character per minute at the exact end of each one minute sequence during the full five minute transmission would have a correct copy rate of 120/125=96% and would fail the exam element.

I propose two methods of scoring the code element: The choice of which method is to be up to the candidate, not the VEC. VECï¿½s must be prepared to use both methods. The two methods are:
1. Over all accuracy of 75% correct copy. This means that a total of 94 out of the 125 characters sent must be correct. They may be in any of the characters sent and do not have to be in sequence.
2. A multiple choice exam that determines if the important points of the passage sent have been understood.
A five question multiple choice exam will be used to score this element.

With regard to examinees with disabilities: Exemptions become irrelevant if the higher speed telegraphy requirements are deleted. A single five word per minute element with a choice of examination scoring technique, to be chosen by the examinee, should resolve this matter in nearly all cases.
F. Written Examinations

A written examination is prepared and administered to each applicant for an amateur operator license in order to demonstrate to the Commission that the examinee possesses the operational and technical qualifications required to perform properly the duties of an amateur service operator licensee. The written examination for each license class currently specifies ten general topics The ten topics are:
ï¿½ (1) FCC rules for the amateur radio services;
ï¿½ (2) Amateur station operating procedures;
ï¿½ (3) Radio wave propagation characteristics of amateur service frequency bands;
ï¿½ (4) Amateur radio practices;
ï¿½ (5) Electrical principles as applied to amateur station equipment;

ï¿½ (6) Amateur station equipment circuit components;
ï¿½ (7) Practical circuits employed in amateur station equipment;
ï¿½ (8) Signals and emissions transmitted by amateur stations;
ï¿½ (9) Amateur station antennas and feed lines; and
ï¿½ (10) Radio frequency environmental safety practices at an amateur station.

These topics can be further divided with regard to that portion of the spectrum applicable to a license class and weather or not the topic is germane to the operator privileges contemplated by that class. For example, an examinee for the proposed Class A license should not be asked questions from topic 10 since the power levels and antenna restrictions proposed for that class do not allow for a hazardous situation to arise. In the case of an examinee for the Class D license questions about waveguides, for example, would be appropriate. A uniform national database of multiple-choice questions and answers is approved by the National Conference of VECs ,periodically updated on a regular basis so that all publishers and applicants have access to current materials, is highly desirable, and the FCC should retain this feature of the VEC system.. This is accomplished on a purely voluntary basis, without formal Commission involvement.
In light of the fact that written examinations now have been prepared and administered under the VE system for over a decade, without major problems for the amateur service or the Commission, I personally see no reason to provide VEs and VECs additional flexibility in determining the specific contents of written examinations. There may be disadvantages to providing such flexibility as extreme views may tend to influence the design of examinations and interfere with the licensing process..

In my opinion the general topics set forth in Section 97.503 of the Commission's Rules adequately cover the significant categories of information relevant to determining whether an applicant has the requisite operational and technical qualifications to become an amateur licensee. You ask, ï¿½Does the current list of topics adequately cover current technology and contemporary amateur operating practices?ï¿½ This question can be adequately addressed by the VECs during the periodic review of the question pool.

. In addition, you ask commenters to discuss whether the required number of questions from each general topic should continue to be established by rule. To ensure uniformity I recommend that the required number of questions from each general topic should continue to be established by rule. Further, I suggest that the number of questions be fixed according to the chart below:

Spectrum Segment Entry Level License Classes Full Privilege License Classes
Below 30 Mhz Class A45 questions + 75% on code testor50 questions if multiple. choice is used for code test Class B50 questions
Above 30 Mhz Class C50 questions Class D 50 questions

Questions will be taken from the pool and from the relevant topics for each class.

V. CONCLUSION

I propose: (1) to phase out the Novice Class operator license (current licensees grandfathered to Class A privleges) and the Technician Plus operator license (current licensees grandfathered to Class A and D privleges); (2) to authorize Class B and Class D operators to prepare and administer examinations for the Class A,B and C,D operator licenses; respectively, and (3) to sunset RACES station licenses by not issuing any license renewals.

The rest is too long to publish here. I will be posting it on the WEB soon.

Let the debate rage!

I'm a Tech - Plus and have been banging out contacts on the novice portions of the 15, 40, and 80 meter bands. My code speed has increased dramatically since deciding to get on the HF bands doing code instead of hopelessly practicing with audio tapes until reaching 13 wpm and then never going back to CW once upgrading (that's what many of our fellow hams do). For all you old timers out there who love their code and feel it should stay, well I agree. I was wondering why virtually all the special event's do not include the novice portions of the HF Bands in their Communications Plans. I'm beginning to think that the Ham community (deliberate or not) excludes the novice operator from special events when actually they should be providing the new guy every opportunity to participate. Setting up on a Novice Freq is not a whole lot of effort, but would reap much benefit. Especially when considering that our lower ranks are dwindling and techs are never going past 5wpm.
The FCC with the ARRL are considering major changes to the CW requirements and has created an explosion of debate. I think the ARRL is doing the right thing. Ham Radio is dying a slow death. Perhaps all Hams should ask themselves what they've NOT DONE to help the new guy thereby forcing the ARRL to take drastic measures to save the Hobby. Does the word SPECIAL in "Special Event" mean "Novice need not show up" ?

The real question is, why would anyone want either one of these clunkers?
The TM-V7A is an intermod sponge,can't be seen on bright or even semi bright
days, very slow scanning , just plain ugly piece of crap. The TM-G707A is
worse yet. For starters: very ugly, no cross band repeat, can't listen to
both channels at once. It is technology back to the early 80's. Can't
imagine anyone ever buying one of these clunkers.

Anyone out there with experience noise-suppressing a Toyota Tacoma? The IC-706MkII in my 1996 truck takes care of ignition noise nicely with its blanker. But there's still a white-type noise, non-varying with engine speed, worse on lower HF bands, nearly gone by 10m. Noise disappears completely when antenna removed.Noise appears only when engine is actually running, does not seem to appear even momentarily when ignition turned on before engine start. Suspect computer but possibly fuel pump?

Date: 1998-09-13 00:00:00 UTC
From: isrus@aol.com
Message-ID: <1998091323201700.TAA18438@ladder01.news.aol.com>
Source record: 132093

Any help on where I can get a reasonably priced replacement spring for the latch for the bottom cover on this radio? I know the manual says to watch out for it but accidents happen and mine is gone after opening the radio for small repair.

Brian:

Consider a used Icom IC 706. You can get them for about $750 now. A lot of radio for the money.

Source record: 132101
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

I have on loan, with an option to buy, a TS-520, but the manual wasn't available at the time. I powered it up with my antenna connected, but the only sound I heard on any band setting was hiss. I tried adjusting all of the controls, but no difference was heard other than the AF gain.

There are 2 tybe-socket-style ports on the rear panel, one labeled EXT VFO and the other REMOTE. Is there a jumper plug that must be installed here when these optional units are not, to make the rest of the unit operate normally (I know that my Hallicracters has such a plug.)

If not, does anybody have any suggestions on what else might be wrong? Any common failures with this symptom?

Lastly, assuming that we can get it to work, what ballpark of price range is fair for this rig?

The VFO plug must be installed or a jumper installed between pins 8 & 9
on the VFO socket. The remote plug doesn't need to be installed..

Source record: 132105

Thanks for any help in advance!

My 890at seems to have a glitch, When I put the tuner in line I get
a high SWR icon on the display. With the tuner off SWR is 1.5:1 ! Has
any one run into this problem? I know the antenna is tuned .
All this started up without any intermittent probs prior.
Thanks Steve KC2COU

Don, there IS a place.

It is kind of strange but the BOB DUCKWORTH's APACHE AUCTION SITE
has sold a number of things at VERY VERY low prices.

I have found it is a great place to unload stuff I don't need and give someone
a bargain at the same time. There is NO FEE there!

eBAY is getting rich off the sales of things at highly inflated prices. Their
comminssions are huge for something that doesn't cost them much to operate.

Try the DUCKWORTH-APACHE auction site next time!

Go to -
http://www.atl.org/wits/

and then click on Auction.

Some of the cattegories have bizarre sounding names, but I have found some great
deals on radio gear and computer items there! ALso sold a few bits and pieces.

It is nowhere near as big as eBay, but it is FREE!

Your usual response Clinton. A lecture instead of help.

Dave,
Take a look at the Yaesu FT-50RD. It's small, easy to use, modifiable, durable, 5 watts, and often discounted by many amateur dealers. I am very satisfied with my FT-50. The Kenwood TH-78A is also a good dual band radio. Kenwood no longer makes this unit, but it would be one to consider if you find one in good condition at a hamfest. Save my e-mail address and contact me if you buy a TH-78A. I have information you will find useful. Good luck!

John

Clinton,

Let's look at Phil's post.

>Had a VX-1R. Bought a IC-Q7A.
>
>Compared them.
>
>Kept the Q7A. Gave away the VX-1R.
>
>Phil

What word(s) are you having trouble with Clinton? I'll attempt to de-code
Phil's message for you. Here goes.

1. Phil owned a Yaesu VX-1R
2. Phil bought an Icom IC-Q7A
3. Phil made a decision that he preferred the Icom over the Yaesu
4. Phil gave the Yaesu away

Try reading it over and over until it sinks in.

Hey Phil ..... I will e-mail you my address so you can send me the next radio you don't like. <g>

Thanks to you and everyone else who replied. Whilst I'm attracted
to the high current available in switchers, it sounds like they can
be troublesome and I wouldn't mind building something for myself
instead of buying.

4309. Re: A Constructive Discussion Of The FCC Proposal

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-13 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bddecc28307180f08492d0@davidc.bit-net.com>
Source record: 132147
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.policy

From the FCC Proposal:

"We note that an ARRL committee recommended that the number of license classes be reduced from six to five by deleting the Novice Class and restructuring the Technician and Technician Plus Classes ... While we continue to believe there should be a number of license classes sufficient to encourage amateur operators to advance their skills in meaningful ways,[12] six classes of operator licenses may be unnecessary.

"We applaud the ARRL for its creative thinking about ways to improve the Commission's enforcement processes. Its specific proposal, however, appears to be inconsistent with the statutory provisions governing the role of administrative law judges.

"The decreasing role of telegraphy as a communications mode also is demonstrated in our implementation of the Global Maritime Distress and Safety System (GMDSS). Based in part on these survey results, an ARRL committee proposed to reduce the General Class code speed requirement from 13 to 10 wpm, and for all code examinations to specify one out of five minutes of copy.

"We believe that these proposals place an unfair burden on examinees with disabilities, and raise serious privacy and confidentiality concerns. We seek comment on ARRL's proposal and our tentative conclusion.

"When normal communication systems have been overloaded, damaged or disrupted because a disaster has occurred, or is likely to occur, amateur operators repeatedly have provided essential communications links and facilitated relief actions on a purely voluntary basis.

"The Amateur Radio Service rules are designed to provide emergency communications, advance radio technology, improve operator skills, enhance international goodwill, and expand the number of trained operators, technicians and electronic experts."

I believe that the FCC has telegraphed that they would like to eliminate CW in testing and see an encouragement of modern modes, that they see amateur radio is more of an emergency traffic auxiliary than ragchewing hobby, that they see the hobby as valuable in training radio technicians for military and commercial needs.

This said, I believe that absent an intentional proposal that emphasizes these elements the FCC will design their own. And absent significant movement in the hobby in this direction the FCC will sell off the frequencies deemed unnecessary to emergency communications and make other efforts to reshape the hobby towards the purpose(s) they deem best.

I think we have to understand that we occupy spectrum valued by folks with big money and influence and unless we act quickly to make ourselves equally valuable in the eyes of the FCC (and the political and commercial power brokers who influence them) we will lose much of the independence we have enjoyed.

: refuse on the IC706 - Nice bunch to deal with too. G4MPQ/Ken

Watch out if you choose to deal with Juns-they are indeed a nice bunch,
but they resell returned radios as new-without even throughly checking
them first to determine why the previous buyer returned it.
The last time I delt with them, they sent me a "new" HT with scratches, a
loose internal connector, and a MISSING PL board(the model in question
included it as a standard option on the USA units)-and yes, it WAS A USA
version.

On the other hand....

They accepted the return gracefully(although I had to pay to return it).

FWIW, this was at least 6 or so years ago, so prehaps they have cleaned up
their act.

I apparently was not the only person-several other hams that I told this
to (back then) either had experienced similar difficulties, or knew of
other hams that did.

Rob, there's been alot of folks asking about info to build the programming cable since word got out that Kenwood would be making one. Have yet to see anyone post a message saying they've been able to build one, so it looks like you're only recourse is to purchase the OEM cable. I've seen other Europeans say that the cable is not available for the V7E, and I don't know if the V7A cable will work or not for the V7E. You may want to email Kenwood and ask them.

Source record: 132158

You can decode SSB transmissions, but it's tricky. Yes, you use the BFO, but should also turn off the AGC/AVC, crank up the audio gain, and reduce the RF gain to the minimum needed to get copy.
Remember that while most utility/mil transmissions are USB, the hams use LSB below 7.5 MHz, so any USB settings you've discovered will not work on LSB.
There are SSB adapters (CV591 or 571 ?) made for the 390 series; they plug into the IF Out jack on the back.
I've found that if you can get a good CW tone (about 800 Hz), that the BFO will go the additional 700 Hz to get the 1500 Hz (1.5 kHz) offset you need for SSB.
The easiest way I've found to set up for SSB is to take a heavily used channel and just play with all the settings (11175 kHz USB is my favorite during the day) until you find the right combination.

I have used lots of older type receivers for SSB and most of them work reasonably well if you use the CW position, which turns the BFO on. Then the audio gain should be turned up, ususlly all the way and the RF gain control used to control the volume. That way the SSB signal does not over power the VFO signal. The VFO is replacing the carrier so that the detector demodulates the signal like it was AM. The VFO needs to be set to one side of the passband or the other. Which side depends on if you are on USB or LSB. For USB the BFO should be placed on the lower edge of the passband.
In addition you need to use a selecetivy position that is 2.1 or greater.
Tuning the SSB signal after doing the above should be done slowly but can be done and you will get better with practice.
I hope this helps.

Here's what I have on it. If you go thru the procedure and put 144 and 148
back in, your radio should be back to original specs.

AT-201 Modification

The ADI AT-201 may be expanded to transmit from 130-179.995 MHz. NOTE: In the
U.S.
it is illegal to use this radio on any band for which it is not type accepted
and on which you
are not licensed. Perform this modification at your own risk!

NOTE: The first step is the microprocessor master reset and will erase all
memories!

STEP 1: Press (F) and (CALL) while turning the radio on. The display will show
all digits.
Release (F) and (CALL). Display reads 145.00. Turn radio off.

STEP 2: While pressing the 3 and (CALL) buttons turn the radio on. The display
will show
a 3.

STEP 3: Turn radio off and then on again. Radio will now display between
100.00 and 179.995 MHz. However, the PLL is still locked and the radio will
receive only between 130-170 MHz. Transmit remains between 144-148 MHz.

STEP 4: Change STEP size to 5 kHz by pressing (F) and 3 and then rotating the knob one
click left. Display reads 05.

STEP 5: Press (F) and 9. Display reads 00.60. Change it to read 30.63[50]. (NOTE: The
last two digits look like a tiny 50.) It takes many turns of the knob to reach this number,
but you speed things up by holding down the (F) key.

STEP 6: Change the STEP size back to 10 by pressing (F) and 3 and rotating the knob one
step right.

STEP 7: Press (F) and 0.

STEP 8: Press 7. The display reads just a decimal point.

STEP 9: Press the number 3, 0, 6, 3.

STEP 10: Press the * key. The display reads 130.00.

The modification is now complete. You may need to change the band limits of the radio to take advantage of the extra frequencies, though. To do this follow the example below (which shows how to set the radio to work between 148 and 169.995 MHz.

STEP 11: Press (F) and 0. Release (F) and 0 and then press 7.

STEP 12: Press 4, 8, 6, 9.

STEP 13: Press *. TX range is now 148-169.995 MHz.

4323. Hallicrafters Parts Needed...

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-13 00:00:00 UTC
From: DA Honeycutt <k3458@leo.infi.net>
Message-ID: <35FB5637.46DE31F2@leo.infi.net>

Hello,

I have a Hallicrafters S-119 SkyBuddy II that I am restoring. The perforated plastic speaker grille is destroyed and I need some type of material to replace it with. Can you advise me where I might be able to obtain the original material or a good replacement material?

Please email any suggestions that you might have.

Your help will be greatly appreciated,
David

4324. Re: A Constructive Discussion Of The FCC Proposal

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-13 00:00:00 UTC
From: cwt851@megsinet.net
Message-ID: <35fb9a10.15507390@news.megsinet.net>
Source record: 132162
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.policy

I am all for the decrease in the code requirement for a
variety of reasons, it has become an outdated mode of operation in an
emergency situation. However I would like to see an increase in the
level of knowledge needed to pass the written exams.

I would also like to see some sort of "hands on" test by
either building a simple circuit using a schematic, or demonstrating
the proper way to wire up a station and TX. i.e. hooking up grounds,
making jumpers setting proper modulation levels etc.

Maybe even a computer simulation of a pileup where
manipulation of filters, etc is required to copy a station.

I know that administrastion of testing for some of the above
would be more difficult, but I strongly feel that in order to "save"
the hobby we need to foster interest in doing projects ie.e. building
little gadgets and proper, standardized operating practices.

As far as losing spectrum. I cannot forsee losing the HF
bands since they are so unrealiable for business-type communications.
I cna see some trimming of the 440Mhz band. In some areas it is a
needed safety valve for a crowded 2 meters, though in most areas it is
pretty dead. As far as propagation it doesn't offer any significant
differences over 2 meters.

I have read the entire FCC proposal and I didn't get the
feeling that they were trying to steer the ham community in any
specific direction. Other than decreasing administrative hassles with
the testing and updating the spectrum of knowledge needed to use
digital modes. I'll look through it again......

>it????

Walter,
Here is some info on the battery I've collected from the Yaesu
Reflector. My battery went dead last week. I called Yaesu and ordered a
new one (about $10 including s&h), but they are on backorder. Yaesu told
me they should be back in stock in a few weeks. Hope this helps.

> those rear top cover mounting tabs too - they are easily broken off.

: Replacing it, unfortunately, is not a simple task. The
:battery is soldered to the top side of the bottom board, and the
:only way to get to it is to remove the case of the radio and
:then, one by one, remove all of the the board-to-front panel
:connectors until the top board can be separated from the bottom
:one. It is not a job for the queasy. :-)

From: llefczik@motown.lmco.com
Message-ID: <6tjqhrhnc1@nnrp1.dejanews.com>
Source record: 131968

I have an IC706 (Mk I) and was wondering if there is a mod to turn the fan off when it is just sitting in the receive mode? A thermal switch may-be? Or just bring it up in transmit?

Also, I understand there was a mod going around to change the tap-in point for the Noise Blanker to make it more effective. Does anyone know the specifics and how difficult it is?

This is one of the most appropriate and on-target comments about eBay,
and auctions in general, that I've ever read.

One kind of item for which eBay has actually improved the auction process
is phonograph records. The customary way for auctioning them has been
for the seller to send lists in the mail, and bidders submit their bid.
It's not a highest bid with a proxy system like eBay--what you bid is
what you bid. You never know if you're bidding high enough or not until
it's over. And you don't know if you're bidding way too high or not.
eBay has actually improved the auction process in this one regard.

Folks,

Do any of you know a good source for replacement 572B tubes? I'm told that the Svetlana tubes may cause problems in the Yaesu FL 2000B and 2100B amplifiers due to their slightly higher gain and different bias requirements. I don't really want to modify my unit when the tubes are replaced if I don't have to....

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150

148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder

on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Minimum Volume Setting

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760

email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Just to let you other people know. The reason Murray said what hedid
above, is because he looked up my call sign and saw that I am
a lowly technician. Yes I admit it. Let this be a warning to the ones
that buy from him. He thinks he's better than us.

>I hope this helps.

I have several old receivers and do not understand that SSB could be so
difficult to receive. Problem with some old receivers are that BFO is
not strong enough compared to the ssb-IF signal to the detector. The BFO
should preferably be 5-10 times as strong as the SSB from the IF.
Cure is to decrease the IF signal and increase the BFO.

I have always heard that product detector is neccessary for ssb
receiption, but one of my receivers* has envelope detector. IF is
divided into two sections with 2x 6BA6 and 6AV6 detectors, the BFO does
not leak into the AGC. BFO was increased to 5V and IF is 1-2VRMS. I
listened to several strong German and British ssb stns on 80 and 40m ssb
in the evening, it works ufb quality - even with the AGC on and full RF
gain.

I am surprised to learn that 6AT6 or 6AV6 has so good quality for ssb,
and product detector seems not too important to add.
*)German "Lorenz 6P203" AM/CW coast stn receiver, built around 1960.

And you never know who you're bidding against.... Even if it's the original seller..shilling.

I know of at least one case in the RADIO arena where eBay found a man using multiple accounts to shill and booted him off...errr, well...almost. Many of us are sure he's still selling and probably shilling under another name. eBay now will do little about it!

wireless....

I agree that it is a sellers paradise there. Once in a great while you
can catch the bidders off guard as I did when I bought a radio from there. I
actually paid about the right price or maybe a little less considering he
also had about $150+ in accessories. The nice thing about ebay is that you
can check the sellers track record (if he does a lot of business on ebay).
This is a very nice feature that set me a bit more at ease. I was very
satisfied with that particular deal.

Depending upon the actual condition, and the accessories included with the radio, this is a good price. I have one. It's a 2m only HT. Reasonably compact, very rugged, full featured, and easy to program. I bought mine second hand four years ago, and haven't had any trouble with it.

Help!

I bought a clean Azden PCS-3000 at a hamfest over the weekend. It worked fine at the show, but when I powered it up at home, the processor seemed to be locked up -- no RX or TX, and several odd characters on the display.

The sticker on the radio says, "if microcomputer malfunctions, see page 12 of manual to restore normal operation." But part of the reason for the terrific price on the radio was the lack of the owner's manual.

Various efforts at button-pushing combinations and ways of turning the radio on and off (with my nose, my toes, etc) haven't been successful. Anyone out there have a PCS-3000 or know how to reset one?

Also, the ham I bought it from retired it more than a year ago when he bought a new mobile, and the memory battery is dead. Is this why the radio locked up now?

Thanks in advance,
--

Hi
I am in need of a schematic for a Trygon 40 Volt 10 Amp supply.
It is a 3" high rack mount lab type supply.
I am trying to repair a problem in the current limiting area.

Any help would be appreciated.

Thanks

I agree. Almost all the dealers that sell their radios on Ebay fully expect retail or higher. Although I have purchased radios from Ebay. I limit my participation due to the very high prices. I mainly go for the stuff others are not interested in.

But clearly the dealers want NO LESS than retail, and are happy to get far above that. But in the final outcome it is us, the buyers, that cause this problem. No seller is forcing us to purchase their goods.

SO bid responsibly, and LET THE ITEM GO IF IT IS TOO HIGH. If we the buyers start to get this discipline, prices with retreat!!!

That's "my opinion on the subject..

Thanks, Clint, for asking me these questions when I was asking you about your VX-10 and your FT-50. I was not licensed at that point and I didn't even know the questions to ask. Now, I am a licensed Tech (no-code until I learn 20 wpm!). I bought a used FT-50 and I think it is really great. I am sure there are many features on it that I will never use, but who knows, maybe someday I will!

When I was looking for my first rig, I had a big list of thing I wanted it to do, some were realistic, some were not. Clint was able to tell me that and get me pointed in the right direction. I've had my callsign for 2 days now (I've been scanning for the past 2 weeks) and it is a great hobby with lots of people ready to help you out.

What an opportunity! It doesn't work, so offer very little!

And, you're right. You need to jumper pins 8 and 9 in the EXT VFO socket, top right as you view the rig from the rear.

Most interference is due to poor quality consumer equipment, but there are an increasing number of CB, pirate, and Ham operators who run illegal power with poorly constructed equipment into poorly designed antennas ... especially since the FCC all-but ended active enforcement of rules and regulations.

You might consider a letter or phone call to your Congressman and US Senator requesting they prod the FCC to get back to serious enforcement -- they have vans that could easily document illegal and/or improper activities on the airwaves and would confiscate his gear and fine him significantly if guilty.

You might also consider a "malicious interference with legal commercial broadcasts" sort of legal filing against him -- might get his attention, if such a filing is even possible. You might also notify the local radio and/or TV stations that he is interfering with their broadcasts in a whole neighborhood (perhaps with a petition from several neighbors) -- big commercial concerns tend to have more clout!

It is important that you carefully document times, frequencies, efforts to filter, efforts to request his cooperation -- and to communicate this information to the aforementioned parties clearly and calmly.

BTW: Are you certain this is a Ham and not a pirate or a CBer? Also, did you mean AARP or ARRL? The Clinton anarchist and selfish mentality seems to have had its corrupting impact everywhere! Pitiful.

An interesting tip, at that. Does the user of the phone do the
programming, or is it mediated/arbitrated by the cell site?? If the
cell site is still involved, you then have a trunked radio system.

Interesting idea, though.

Erik,
The PK-232/DSP has new filters for all the PK-232 modes, including
Amtor/Navtex. All the new filters are linear phase FIR filters.

The PK-232/DSP daughterboard is installed internally in the PK-232/PK-232MBX
and gets its power from the PK-232/PK-232MBX. It does not require an
additional external power supply.

4389. Heathkit coils?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-14 00:00:00 UTC
From: NULSPAMwier@calcite.rocky.edu
Message-ID: <NULSPAMwier-1409980128210001@205.162.163.92>
Source record: 132035

Hi!

I'm looking for Heathkit coils to put an SB-620 on 3395 Kc. Since I've become convinced that I'll never find them with a SB-620 that was built for 455 Khz (which seems what everybody did), I'm thinking that MAYBE these were also used in other Heath amateur gear at the time. They are:

40-776 and 52-101

Perhaps I can find another (more common) rig that's a junker that I can get these from. So if anyone out there happens to be looking in a Heath manual and finds them listed, I'd appreciate a shout.

THANKS and 73s de WB5KXH

4391. prm80 30 software

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-14 00:00:00 UTC
From: Paul <paulsm@mailexcite.com>
Message-ID: <35FCD849.CEA6FE1@mailexcite.com>
Source record: 132037
Cross-posted to: alt.ham-radio.marketplace,aus.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.cb,rec.radio.scanner,alt.radio.scanner.uk,rec.radio.swap

Hi, I'm after the programming software for the philips prm80 30 series radio.
Any help would be appreciated.

Thanks,
Paul.

The IC765 has no external power connector, but there is an internal
one.

With a bit of care you can try the thing on an external 30 amp 13.8v
supply. This ought to prove the bulk of the radio OK and leave you with
a switch-mode supply to debug. I once rebuilt one that had been run on
the wrong mains voltage (220v when the supply was set to 110v... someone
had tried to change the thing over in Australia, but the manual forgets
to mention a wire link mounted UNDER the mains rectifier bridge) let's
just say it was a mess.

look for bad solder joints, and possibly low reservoir capacitance.

You'll need an isolating transformer and a good DC load to work safely.
The control IC is obsolete, and I believe Icom may have a lifetime buy
if you need spares. Take care over the faraday screen plate located
amongst the insulating washers of the switching transistors, and those
fins are very very sharp.

If you're not experienced with working on switchers, you need an
experienced guide.

Cheers
David GM4ZNX

4394. Need Help Standard C228 Schematic (Parts)

I Have A Standard C228 Dual Band HT (Heath HW24T) And I Am In Need Of A Schematic And Or A Parts List.
Part # Q202 On The Board Is Missing (Main Board Behind Key Pad) & The Traces Broken. Can Any One Help (Please)

The People At Standard Are Pure A-Holes. And Will Not Sell Me The Parts Or Give Me A Part Number Or Interchange Or Even Tell Me What Belongs There. Also They Advised Me That It Would Cost To Much Money To Send It In For Repair..
What An Outfit. I Will Never Ever Consider Any Standard Product Again...

Hello,

does anybody know any modifications for the Standard C-156 (A/E) portable ?
I searched the internet, but the known mod-ftp-servers (oak.oakland.edu etc.)
had no new files.
If you know where I can get the mods, please send me an EMail or a reply.

Thanks in advance,

Not sure if you are referring to a 757GX or 757GX II. This information applies to the GX II and may be the same for the GX. The battery is located inside the radio on the top board towards the rear. It is a lithium 1/3N type (Radio-Shack CR1/3N, Eveready 2L76, Duracell DL1/3N). The battery looks like a small capacitor and it is soldered in place (mine was blue). I was able to peal the tabs off of the old battery in place and solder the new battery from Radio Shack (which has no tabs) onto the old tabs. I thought of trying to remove the board from the radio and remove the solder tabs but that job is not for the faint of heart. You might also want to check with Yaesu. I remember a post from about two years ago from someone who called Yaesu about a replacement battery and they sent him one for free.

If Yaesu had been smart they would have put the battery in a battery holder. I had thought about getting a holder from Digi-Key and doing the surgery necessary to install it. However, they battery only needs to be changed about once every 5 years and I cannot justify the level of work required.

Hello,
I have a Toshiba clone laptop 486 dx4 100, with 200 meg HD and 8 meg
ram. Active Matrix monitor. Loaded with dos 6.2 and Windows 3.1.
I also have a Kenwood tm2570a, 70 watt 2m mobile, with pl tone
board.
I also have an ADI 201 ht with charger and handmic.

I am offering all of this for trade for a digital HF station in good shape.
Something along the lines of a Kenwood ts 430s with P/S and Antenna tuner.
Or even an Icom 740 or 745 with P/S and Antenna tunner.

You can e-mail me at:
johnkf4rkk@zebra.net
johnkf4rkk@zdmail.com
kf4rkk2@mindspring.com

4403. Odd Icom 735 RF Gain Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-14 00:00:00 UTC
From: cshelton@osf1.gmu.edu
Message-ID: <6tj10h$s2o@portal.gmu.edu>
Source record: 132049

My Icom 735 has suddendly developed a peculiar problem. If I set the RF gain to more than 80% of maximum, it completely mutes the receiver. Once I slide the gain down below about 80%, the rcvr works fine. Sudden onset, sno apparent cause, no other symptoms. Anyone else run into this, or have any idea of what's wrong?

Any help much appreciated,
Jeff/KS4TL/cshelton@<n o s p a m>dc.jones.com

From: Andre Konstantinov <konstan@worldnet.att.net>
Message-ID: <6tj3gl$kqj@bgtnsc02.worldnet.att.net>
Source record: 132051

I got the AT-201HP. Great radio but the manual (in my opinion) stinks.

How long am I supposed to charge the battery (I have a HP 12V)? Is the red light (on te charger) supposed to go off when it's charged? do you know if I can leave it plugged into the charger or will it be ruined if i do not disconnect it?

The manual doesn't say anything about the battery... i am afraid to ruin it

You can get the same thing on PCS here in Tennessee. (and presumably
many other places) It doesn't say so in the ads, but I'd be 99.9%
certain it indeed works through the PCS base stations.

If the landline telephone system crashed, I suppose you might still be
able to talk to someone in the same cell, but you aren't going to get
any further..

>

My story.... I bought a Kenwood 530 for $450. in mint cond.
The Ham who sold it to me was around 62 and very nice. When
I got it home it had major problems, the hardest to find was
a cold solder joint on the output tubes socket. A driver tube
was missing a pin. This radio was the pits, not mint.
I failed to get his name or address, Please Don't Make The
Same Mistake. Look at the DL and get the name and address
before buying your rig at a Hamfest. I Learned My Lesson!

The Arctic Amateur Radio Club is having thier annual Hamfest this month here in Fairbanks, Alaska. Check out <http://fytqm.uafadm.alaska.edu/aarc/AARC.html> for more info.

Make it a two hamfest week by visiting the Anchorage Hamfest the weekend before. Now you finally have THE reason to visit the Last Frontier. No more wondering what you're gonna do when you get to Alaska.

I was totally unable to locate any in North America and got mine in less than
a week from Lowe electronics in the U.K., for a fraction of what I expected to
pay.

Lowe is at www.lowe.co.uk

An old ATLAS 210X makes a good starter rig. All solid state, but definitely

bare bones. Not suitable for CW, even though it has a CW mode.
I've bought 'em for as little as $40 at swapmeets.
Heathkit HW-100 or 101
can be had for as little as $25. All tubes, but more features.

I know where there's a broken Swan 250 for $2. I didn't buy it
'cause I didn't think it was worth the price.

Bottom line is don't get in a hurry. Cheap stuff is out there.

The .my on the end of his email address tells me Brian's in Malaysia.
It *may* be legal (or may not...) to build your own CB transmitter
there.

>> I would like to make my own CB Radio so that I can communicate with my
>> friend who stays about 3 Kilometers from here. Does anyone have any
>> ideas of suggestions? I know how to make a CB Receiver with just a few
>> components and I'm sure a tranceiver can be made that way too.

I'm not sure it's cost effective. (even if it is legal in your
country) It's pretty easy to build a simple Morse Code transmitter
for lower frequencies, like the shortwave ham radio bands. Making one
for 27MHz is much more difficult - it's hard to keep it on frequency.

If you really want to try, do a web search on "QRP homebrew". And
again, be careful - there's a good chance it's illegal in your
country...

Although I haven't actually tried it while in cross-band repeat, the radio
behaves as if it powers on when you plug in the control head. Assuming that
is in fact the case, you probably cannot do what you want. Why not try
putting the control head on the radio (wherever you've tucked it away) when
you want to do this? Perhaps a bit inconvenient, but...

I don't know of any country that permits people to make their own CB radios. The USA and I think all other countries require some form of type acceptance. I think only licensed amatuer radio operators are permitted to build their own transmitters and put them on the air.

4433. FT50/MAHA Multi Charger

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-15 00:00:00 UTC
From: sir-dan@webtv.net
Message-ID: <9190-35FF0BE4-3@newsd-153.iap.bryant.webtv.net>
Source record: 131881

Is the MAHA Multi Charger a rapid charger? Is it REALLY as versatile & convenient as the advertisements make it appear? Is it worth the $50 price tag?

I bought a used FT50 and had the 6V 600ma battery attached to the NC60B charger all night....used the radio for an hour or so, programmed and named the channels, and it died...less than 2 hours of service....does it need all 15 or so hours to fully charge? Would the MAHA have made a difference?

Has anyone used the Radio Shack version of the Multi Charger? (same $50 price tag)

Also consider......the battery MUST BE ATTACHED to the FT50 for it to be charged....the battery cannot be charged separately (as it can with my FT411).

Thx for the help.

I have for sale an ICOM model IC-2000H 2 meter FM mobile ham tranciever.

The unit is new in the original box with warranty card and all accessories.
Its never been used. I won it as a door prize at a recent hamfest.

The box has been opened once to look at the thing and decide that I liked
the tranciever I already had a little bit better. And once more to
refer to the instruction manual as I type this feature list:

- Transmits on 2 meter US ham band.
- Extended recieve from 118 to 174 MHz.
- 50 watts max output, medium and low power settings put out 10 and 5 watts.
- Microphone has DTMF pad and channel up/down buttons.
- 50 channel memories
- can send CTSS repeater tone as-is (CTSS decode requires optional module)
- can scan whole recieve band, memory channels, or programmed range.
- auto-repeater function
- 6-character alphnumberic labels can be entered for each memory channel.
- power supply: 13.8v, 10.5 amps (less at lower output power)

I think this model may be being phased out by ICOM, in favor of a similar
unit which has PC remote programming (which explains why they
provided them as door prizes). How many of y'all have PCs in the car anyway?
I've seen this model in a recent catalog for $225 after a rebate. Mfr's
list was supposedly $310.

Asking $200. Buyer pays shipping or picks up in Chapel Hill.

What I am looking for is a classic GDO. I used one in the military and it was well built with quality coils. I built a Heathkit GDO quite a while back and was not satisfied at all with the end result (I know that I've left the door wide open with that statement). The Heathkit was very light and ran off a battry and the Mil version was line powered and heavy. For outdoor antenna work the Heatkit was OK. For indoor bench work the old Mil type was/is the way to go.

4443. Wanted: MW-1 mic for FT-5100

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-15 00:00:00 UTC
From: v <w0bov@kc.net>
Message-ID: <B6HL1.306$2M.327039@newsfeed.slurp.net>
Source record: 131891

I am looking for an MW-1 remote mic kit for the FT-5100. Please tell me your price and the conditions. Thanks.

W0BOV

4444. For Sale: TS-450SAT

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-15 00:00:00 UTC
From: v <w0bov@kc.net>
Message-ID: <F6HL1.307$2M.327039@newsfeed.slurp.net>
Source record: 131892

I have a mint, in box with manuals, cw filter, ssb filter, auto tuner
TS-450SAT. Will pay shipping.
Also available the MC-60 desk mic. Asking $795 for the radio and $75 for
the mic. Will sell
both for $850.

4445. Re: FT50/MAHA Multi Charger

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-15 00:00:00 UTC
From: davem@groucho.cs.ubc.ca
Message-ID: <6tnk85$no3@groucho.cs.ubc.ca>

sir-dan@webtv.net (danny) writes:
>Is the MAHA Multi Charger a rapid charger? Is it REALLY as versatile &
>convenient as the advertisements make it appear? Is it worth the $50
>price tag?

It seems to be a good charger - I've charged a number of NiCd and NiMH
packs with it. It has both voltage and temperature sensing.

>I bought a used FT50 and had the 6V 600ma battery attached to the NC60B
>charger all night....used the radio for an hour or so, programmed and
>named the channels, and it died...less than 2 hours of service....does
>it need all 15 or so hours to fully charge? Would the MAHA have made a
>difference?

The charger built into the FT-50 charges at about 60 mA, and yes it takes
15 hours for a full charge with that battery. The MAHA would charge the
same battery in a bit over an hour (650 mA charge rate). Both of these
assume that the battery is still in good condition.

>Has anyone used the Radio Shack version of the Multi Charger? (same $50
>price tag)

Haven't tried it. It does charge at 800 mA instead of 650, and claims
to charge lead-acid batteries. It seems to be aimed more at camcorder
packs, while the MAHA is aimed at transceiver batteries. The hardware
of the two chargers is obviously the same, but the firmware may be
different.

>Also consider......the battery MUST BE ATTACHED to the FT50 for it to be
>charged....the battery cannot be charged separately (as it can with my
>FT411).

The FT-50 battery does not have its own charger circuitry or place to
connect a power source. However, you can buy the Vertex CA-15 charging
stand. The wall wart power supply that comes with the FT-50 plugs into
the CA-15. You can drop the FT-50 with battery, or just the battery
alone, into the recess of the CA-15 for charging. It charges at 90 mA
(current regulator built into the CA-15), so it takes only 2/3 as long
as charging through the FT-50. So you can charge one battery while
a second one is on the radio.

Yaesu sells a fast charger with interchangeable cups for use with the
FT-50, FT-51, and others. This will charge your pack in under an
hour. It works fine, but costs a lot more than the MAHA MHC-777.
(Yaesu does not recommend using this charger with NiMH batteries).

MAHA also makes a drop-in fast charger specific to the FT-50 shape.
It's convenient (like the Yaesu), but also more expensive than the
universal charger. MAHA says it's OK for their NiMH packs, at least.

Choices, choices...

Dave

4446. Re: MAHA charger and W&W NiMh battery compatibility

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-15 00:00:00 UTC
From: davem@groucho.cs.ubc.ca
Message-ID: <6tnkot$noq@groucho.cs.ubc.ca>
Source record: 131894

dgf@netcom.com (David Feldman) writes:
>The charger seems to go through the motions of charging the battery,
>only it happens *very* quickly (usually <5 minutes). The battery appears
>to be charged (on the HT the HT works properly), but the HT runs down
>*very* quickly (<1 hour of squelched time).

I've noticed that this MAHA charger sometimes stops charging very
quickly with NiMH cells that are almost discharged. What *might* be
happening is this: Discharged cells have high internal resistance.
A bit of charging drops the internal resistance, and raises the no-load
terminal voltage. But with the high currents used in fast charging
(600-800 mA), the drop in internal resistance might make the battery
terminal voltage go *down*, even though the no-load voltage is going
up. So the charger sees a voltage drop and stops charging.

When this happens to me, I momentarily disconnect the battery from
the charger and then reconnect it. The charger starts a new charge
cycle, and *this* time the battery gets fully charged.

I have not seen this problem with even fully discharged NiCd cells
(maybe internal resistance stays lower?). Also, the very same NiMH
batteries described above do *not* show this "5 minute charge" effect
if they were only partially discharged before charging.

>I heard that it takes a few charge/discharge cycles to get a NiMh
>battery to behave to spec, but this seems awfully extreme, and after
>several cycles the situation has not improved.

They apparently take several cycles to get to full capacity, but that's
a different effect than you are seeing.

Another suggestion: trickle charge the cells for the first full charge.
I've seen several manuals recommend this.

>Also, can the NiMh battery be used with the HT's built-in trickle
>charge mode (small AC powered wall-wart supply), or is this only
>specific to NiCd?

NiMH batteries can be trickle charged. Multiply the charge time by
the difference in capacity, and add some. (1200 mA cells take more
than twice as long to charge as 600 mA ones, because charge efficiency
is lower at the lower (relative) current). Don't leave them on
trickle charge forever - NiMH is less tolerant of overcharge than NiCd.

>
> Bob Sikes

Very few new HR2510's exist. Used ones will be listed on DejaNews once
in a while. New Lincolns are available and are still being made. Either
rig would serve you well. President sells the Lincoln. All 3, the HR2510,
HR2600, and Lincoln operate the same once the Chipswitch IC is installed.
To read about the dozens of added features the Chipswitch IC gives these
radios, go to http://www.chipswitch.com where sites that sell the Lincoln
radio are also listed.

Does anyone have ANY info on a Regency XL2000 mobile VHF radio. This is an old fire service radio that I bought while I was a volunteer firefighter for use on duty. It worked well, and the person I bought it from set it all up, then moved away.

I was told it used to be bench programmable, but had been modified to be field programmable by using a switch added to the back panel, and a key sequence (which I don't know). I always remember this radio working great, it's got a 10 channel memory and scan feature. I'd like to learn how to program it, and learn if it is useable in the 2M ham bands.

73, Thanks for any response - Barry N0WOZ, Loveland, CO

> I think you just scared hell out of him!

I'm a little confused. You who and which him? :/

The point I am making is that if the cell site (Masataka stated, after all, that the "...cells...allow you to use...") is involved in the arbitration of the desired simplex frequency between two phones, the phones are still useless without the cell site, unless the user can directly enter a [frequency, channel number].

If I invoked FUD with my comment, it was quite unintentional. "Just the facts, ma'am (or sir)."

I'm certainly not scared--I have my radios -- including a couple of old CG beacon transmitters rated 3KW@330KHz (broadband output may go to 160m....)

Hi. I'm quite new to this CB Radio thing. I have browsed through several web sites and got a bit of information about CB Radios.

I would like to make my own CB Radio so that I can communicate with my friend who stays about 3 Kilometers from here. Does anyone have any ideas of suggestions? I know how to make a CB Receiver with just a few components and I'm sure a tranceiver can be made that way too.

If anyone can give me information on how to build my own CB Radio or links to web sites that shows how, I would really appreciate it.

Thanks in advanced.
Brian. :)

I am also very happy with my V7A. It is a much nicer radio that most of the Icom and Yaesu dual-band radios. I have owned many radios from HF to VHF/UHF and the Kenwwod ranks right up there at the top. It is light years ahead of the Yaesu FT-8500 (that is hard for me to say because I am a Yaesu fan...most of my gear is Yaesu...love that VX-1R). The V7A also does a nice job on cross-band repeat. I have the V7A set up to work with my Yaesu VX-1R. BTW:

Ask one person a question, you get one answer
Ask 10 people a question and you get 10 answers.

Please keep this in mind when you hear other peoples opinions of radio gear. The best bet is to try it for yourself. You be the judge.

Any diode works great. I used 1N4148 which is a general purpuse diod.

You may find that you need to alter the X-tals under the diode matrix
board in order to get the unit to operate in the band segment of your
choice. Check the old X-tals and you should get a good idea of how to
reprogram it. I think the VCO operates under the desired frequency in
the transmitter. When on TX the VCO operates on the TX frequency.
Judging (how do you spell that word?) from my U12 I would guess that the
X-tals are multiplied by 3 and then you have to add the divisor from the
diodematrix mutiplied by 12.5 khz (at lease that is what I did. The IC-2
has as step of 5 khz but i would guess that your H12 has the same step
as mine U12.

Hi folks :) I'm an electronic musician *seriously* looking for the following electronic musical equipment, in any shape, even broken:

-OLD SYNTHESIZERS from the 60's-80's Moog, ARP, Oberheim, etc

-OLD KEYBOARDS w/ knobs or sliders Roland, Korg, Sequential, etc

-OLD DRUM MACHINES w/ terribly electronic sounds :)

-OLD SEQUENCERs w/ knobs for each step

-OLD VOCODERs for that "robot-voice" sound

-***MODULAR PATCHABLE SYNTHESIZER GEAR, complete systems or individual modules - "Switched on Bach Moog", ARP 2600, Paia, anything similar.

-RACK SYNTHS, INTERESTING EFFECTS and anything related to the above.

-Moog, ARP, Korg, Roland, Sequential Circuits, Oberheim, Yamaha, EML, Electrocomp, EMS, Synthi, Putney (VCS3), RSF, Buchla, Serge, Polyfusion, Ionic, Paia, SMS, Wavemaker, E-mu, Steiner-Parker, Chroma, Aries, etc.

-Roland TB-303 Bassline

-Roland TR-909 Drum Machine

-Roland TR-808 Drum Machine

-Simmons SDS-7 + SDS-5 + SDS-6 Drum Brains and Sequencer

-Pearl SY-1 Syncussion

-E-mu SP-1200 Sampler Drum Machine

-Sequential Prophet VS rack
-Oberheim Xpander
-ARP 2600
-Korg MS-20/50
-Oscar with MIDI
-Pollard Syndrum
-Gleeman Pentaphonic

If you have any of the above OR SIMILAR for sale or know someone who might, please email me at rolandman1@aol.com

and include phone number as well if you'd like.

Thanks in advance and apologies if this post annoys anyone.

From: ve3jtr@rac.ca
Message-ID: <6tm014$3rd$1@nnrp1.dejanews.com>
Source record: 131938

Hi all! A question to those who have the Kenwood V7A. Can you remove the detachable display while the radio is on? Why you ask? I like the detachable display so I can remove it and the microphone and lock them away in the console when I leave the car. What I would like to do is set the radio into crossband repeat, and then remove the display to lock it up, leaving the radio faceless but still repeating. The manual doesn't say you can do this, but it doesn't say you can't either. Opinions? BTW, my rac.ca address is not working right now, if replying directly, send email to ve3jtr@lks.net Thanks! >
>Thanks,
>WB1DTJ
Dennis,

To determine which keyer mode your K-! keyer is set for, momentarily
press the right two buttons (#3 & #4) together. After receiving the
"?" reply from the keyer, enter the letter "V". The keyer will
annunciate the V setting.

To change the V setting to one listed below, push buttons one and two
at the same time and the keyer should send the letter "F" . Then you
must send the following letter/number combination for the desired
keyer emulation to set the keyer.

V0 (zero) Super Keyer II timing w/dot and dash memory
V1 Super Keyer II timing w/dot memory only
V2 Super Keyer II timing w/dash memory only
V3 Accukeyer timing w/dot and dash memory
V4 Accukeyer timing w/dot memory only
V5 Accukeyer timing w/dash memory only
V6 Curtis "A" timing w/dot and dash memory
V7 Curtis "A" timing w/dot memory only
V8 Curtis "A" timing w/dash memory only
V9 Iambic timing w/no dot or dash memory

If the keyer doesn't accept your input it could be that your keyer
does not have the correct chip to emulate the different type keyers.

If you need anymore help, let me know.

Do they still make grid dip oscillators? If so, who sells them?
I am aware that there are many newer instruments that can give
information accurate to several decimal places. The original grid
dippers were handy instruments. You could get useful information without
a whole lot of fiddling around. They were elegant in their simplicity.

Message-ID: <6tm787$9dv@newsops.execpc.com>
Source record: 131947

I have 2 Radius M-216 UHF mobiles for sale. 16-pin, 25 watt.
Both are in mint condition and have never seen
rough service.

One was used as a base station since new and comes
with power cable, mic, mic clip, base mounting tray.
Model: D34LRA7PA5CK Ser: 778TTL0684

The other was used in a mobile application and comes
with mounting bracket, mic, mic clip, power cable.
Model: D34LRA7PA5CK Ser: 778VQW1819

$300.00 each or $575.00 for both plus shipping.

I also have a limited number of new & unused Motorola
Radius, (M1225, P1225, GM300, GP300, etc VHF & UHF) for
sale at almost dealer cost. These are USA models.
Not export/import. M1225 UHF would be $425.00 plus
shipping for example.

Kenwood TK-760, 860 mobiles and portable procucts also.

If interested in any of the above, email for details
and prices.

It is not legal in the United States to make your own "CB" transmitter. All Citizens Band equipment must be type accepted for the Citizens Band service by the FCC. See Title 47, Part 95 of the FCC rules.

If you want to make your own radio transmitters, you can either do it under part 15 which allow extremely low power transmitters within certain frequency bands, or you can get an Amateur Radio (HAM) license, and build transmitters that operate in the Amateur Radio bands. For more information on getting a ham license see the American Radio Relay League web site at http://www.arrl.org/

As of a few years ago (~1989), you could still order the original Millen
dippers, in tube or solid-state form, from an outfit in Massachusetts.

4487. MAHA charger and W&W NiMh battery compatibility

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-15 00:00:00 UTC
From: dgf@netcom.com
Message-ID: <dgfEzCAI6.MEn@netcom.com>
Source record: 131955

I have one of those "one size fits all" (or such as it is...) MAHA chargers and am trying to use it to charge a (new) W&W NiMh battery pack (has six AA size NiMh cells in series internally).

The charger seems to go through the motions of charging the battery, only it happens *very* quickly (usually <5 minutes). The battery appears to be charged (on the HT the HT works properly), but the HT runs down *very* quickly (<1 hour of squelched time).

I heard that it takes a few charge/discharge cycles to get a NiMh battery to behave to spec, but this seems awfully extreme, and after several cycles the situation has not improved.

So, does this sound familiar to anyone?

Also, can the NiMh battery be used with the HT's built-in trickle charge mode (small AC powered wall-wart supply), or is this only specific to NiCd?

Very interesting thoughts, Mike, and congratulations on your code improvement.

Regarding special event stations not working the Novice segments, I can think of a few possible reasons: First, there is the power limitation in the Novice segments. Second, 10, 15, and 80 meters aren't the best bands propagation wise. Third, the Novice portion of 40 meters is only available in ITU region 2, and practically unusable after dark. Regardless, I don't think that any of the special event stations are malicious. We frequently hear the following 2 complaints: why don't they work more of the CW bands; why don't they work more of the phone bands. Seems you can never please everyone. Why not volunteer for your club's next special event, and work the Novice bands?

I frequently work the Novice bands myself. Hope to catch you on CW!

Mike, AA3RL

I have had a TH-22AT for about three years and am quite pleased with it. It has gotten banged about a little. I am a bicyclist and usually carry it in the pocket of my riding shorts where it gets damp from my perspiration. After many miles no ill effects. I am also still on the original battery pack, although I also have the alkaline battery pack as a spare.

Regarding its range, I live in the San Diego area where there are repeaters everywhere. I rarely have trouble talking to my wife (also a ham) using the two watts from this radio.

I really can't think of anything bad to say about it except for the rubber duckie that comes with it.

4493. Re: MAHA charger and W&W NiMh battery compatibility

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-15 00:00:00 UTC
From: Ed Gaitley <ecgaitley@mail.hac.com>
Message-ID: <35FED334.3EF97696@mail.hac.com>
Source record: 131961

David,

I also have a Maha charger and from my experience it is
more of a rapid charger.
I can put in a weak battery and hit the condition
button and it is fully charged
in about 20 minutes but I've found that it really isn't
actually fully charged.
To get a full charge on a new set of batteries on the
Maha you would have to
leave it on for quite awhile. I use the Maha with my
NiCd HT batteries
as well as my NiMh cell phone and videocamera batteries
and it works great.

With new batteries, both NiCd and NiMh, I usually use
the charger that comes with
the HT or cell phone for the first few cycles until
they are running up to spec,
then I use the Maha charger to put several conditioning
cycles on them.
With the Maha charger, you have to leave it on trickle
charge for awhile, (which is
around 40 mAh I think) as opposed to 70-80 mAh for the
equipment charger.
I leave it on trickle usually over night to get a full
charge. I've found
that new NiMh batteries can take up to 8-10
charge-discharge cycles
before they start performing properly.

Most people seem to recommend that you head for a nearby ham swap meet. The bigger the swap, the more likely you'll find a reasonably-priced unit. You might consider a Kenwood TS-520, a fine older rig with solid-state receiver and tube finals. Typical price is $250 or so at swaps. I've got one, and have had a great time with it. I'm sure other people will mention other used rigs with good reputations as well.

Good luck, and welcome to a great hobby!

Mike,
I got the IC 746 together with the mentioned control SW.
Honestly, it is nice to have, but more than a good looking screen (you see the transceiver and you can use your mouse to tune) isn't there...
I would say, if you have the transceiver at your side and a PC connected to, who needs to control the TRX via PC, additionally?

The frequency sweep is much slower than the transceivers spectrum scope, the memory database is not transferable (you can't move the transceiver's memory to the PC nor the other way round). And you cannot edit the contents of the CW-memories with the SW.

If you can get it for free (as I did), then try it.
But don't spend a buck on it, it really doesn't make sense in real work on the bands...

These were fairly decent ol' radios for their time, Bruce... they weren't in a class with Collins or even Drake gear, but decent. If you can get one for a steal, and would enjoy cleaning it up and using it, it's probably worth more than one pizza.

My Gawd, man!!! Where've you been????
What does it take to convince you? Don't you get around enough to know
that all these "shootout" heavy metal dudes would be on the ham bands
****LEGALLY**** if not for the dreaded and dastardly Morris Code
requirement for getting a license? Once licensed and here, what's to stop them
then??? FCC enforcement??? Have you not heard of them making
that very statement??? Crawl out and look around--and listen up.
If you truly value the ARS as you claim, and are not just some Hi-Tech
troll-puppet, you WILL understand what this means.
Go find the website where the "CB Channels" are all listed. They run all
the way from Channel 1A at 25.165 mcs to Channel 40J at 29.655 mcs!!!
What do you suppose they plan to "do" with the ten meter band???

It sounds like this will be hard to find. Your best option may be to make one. The VFO manual probably shows which pins at one end connect to pins at the other end.

I have the RS version - virtually identical except for charge rate (800mA vs 650mA)and minor cosmetics. It does work on lead/acid gel cells too. I have 3 different brands of HT's and use the charger for all of them. Separate drop-in chargers would have broken the bank. In my opinion, this charger is the way to go. One cautionary note: make sure the contact pins are making GOOD contact with the battery terminals - came close to a meltdown on my ADI battery pack because of misalignment of the contacts. (My fault.) The tiny arc generated quite a bit of heat on the terminal. Fortunately, the smell of melting plastic alerted me before any serious damage was done.

73 de KB8TRK

danny wrote in message <9190-35FF0BE4-3@newsd-153.iap.bryant.webtv.net>...
Is the MAHA Multi Charger a rapid charger? Is it REALLY as versatile & convenient as the advertisements make it appear? Is it worth the $50 price tag?

I bought a used FT50 and had the 6V 600ma battery attached to the NC60B charger all night....used the radio for an hour or so, programmed and named the channels, and it died...less than 2 hours of service....does it need all 15 or so hours to fully charge? Would the MAHA have made a difference?

Has anyone used the Radio Shack version of the Multi Charger? (same $50 price tag)

Also consider......the battery MUST BE ATTACHED to the FT50 for it to be charged....the battery cannot be charged separately (as it can with my FT411).

Thx for the help.

Back in the days when only women wore earrings and men walked the surface of the Moon, the Motorola HT-220 was the hottest handheld on the market when it was introduced in 1969. Tougher than a pit bull, this VHF or UHF business band handheld in a weatherproof housing was the envy of ham radio operators for its compact size and performance.

4524. Mostly Eimac tubes for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-16 00:00:00 UTC
From: rcote <rcote@pixi.com>
Message-ID: <35FF9178.7900D194@pixi.com>
Source record: 131821

Replace those old tubes that are marginal with a new-old-stock one.
Perhaps buy a spare at these reduced prices.I need to get these sold.
------Have NIC (new in can) 3CX350A/8321 and 4CX350A which have the
same specifications. One a triode and one is a tetrode. Priced at $120.00
ea. or
make a reasonable offer.
-------Also have 2 ea 4CX5000/8170 @ $400 and $600 Both used pulls.Offers
accepted also. These were in Colllins transmitters for the Univ of Hawaii,
and were
used for daily ops for about 15 min per day. The spare transmitter was
only tested
once a quarter so they do not have much time on them.
-------Have 8965 Planar Triode $20 in AES now $8
-------Have 6081 Klystron, I think, as it has a waveguide output flange.
Made by Omni-wave
-------Have 6442 GE UHF amplifier tube, pull from UHF power amp $40 in
AES. now $20
-------Have 7554 GE UHF amplifier, preamp driver tube also listed at $40.
now $20 each.
-------From same power amp, have 4X150A/7034 Eimac tube. $40 in AES, now
$20
===== also have an unopened 3X2500A Glass not Ceramic (3CX) Owner wants
$350, as it lists $650

All above tubes areVarian/Eimac unless otherwise identified.

Ray in Honolulu

4527. Beware! Re: Yaesu ft-101 Power Cord

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-16 00:00:00 UTC
From: nw2m@qsl.net
Message-ID: <6to9cc$o2f$1@nnrp1.dejanews.com>
Source record: 131824
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.swap

Beware that the pin numbers on the plug will not match if you change vendors. There was a post in the Fox Tango Newsletters to this effect. The CJ and AMP connectors have the same pin configuration, but the pin numbers are different.

Ensure that your wiring matches the pin numbers on the FT-101 chassis, and NOT what is on the connector.

Also, if you get a connector without the metal wings, it is possible to mis-connect the plug with disasterous results.

Just a warning from my reading the 14 years of Fox Tango Newsletters.

Al, NW2M
Keeper of the FT-101 web page.

4528. IC706 Fan switch & NB ???

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-16 00:00:00 UTC
From: llefczik@motown.lmco.com
Message-ID: <6toct5$r92$1@nnrp1.dejanews.com>
Source record: 131825

I seem to remember seeing that there was a mod for the IC706 (MK I) to have the fan be off during periods of monitoring. Does anyone know of this mod and if there were any ill-effects?

I also remember talk of changing the tap-in point for the Noise Blanker to make it more effective. Does anyone know the details on this mod? How difficult is it? How effective is it??

Thanks,
Larry WA2EHZ

4531. WANTED FOR THEFT AND FRAUD: KC4UXG, Ron Ernle

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-16 00:00:00 UTC
From: kr4wm@bigfoot.com
Message-ID: <MPG.10697f4d59dd3578989689@news.infoave.net>
Source record: 131828

Looking for Ron Ernle, KC4UXG. Newest information:

RONALD ERNLE
205 CROSSLAKE DR.
PLEASANTON,TX. 78064

If you hear this person on the air, please e-mail me with details of his location. (city, state) It is not known if the above address is true or factual.

A "older" friend of mine, Jervey Coleman of Saint Matthews, SC, "loaned" Ron an HF amplifier and a high-power-capable tuner. He took care of Ron like Ron was his own son for a few months. Ron moved to Florida, and had trouble talking with the folks back here in South Carolina on 75m. So Coleman (as Jervey prefers to be called) let him borrow an HF amplifier and tuner. Ron has not been seen or heard from since. This was about two years ago.

Ron previously was located in Bunnell Florida, and talks with others indicated he moved to Texas, but for the past year or so we have been unable to verify this. Today, something jogged my memory, and I looked on the QRZ website, and I see that Ron updated his address with QRZ on July 10th of this year. This address is posted at the top of this message.

Coleman has made up his mind that he does NOT want to prosecute Ron, but DOES want to give him a piece of his mind! If you can come up with a local phone number for this scoundrel, it would be GREATLY appreciated. Please forward this to me, and I will see that Coleman gets it.

73 all, -Web Williams in Myrtle Beach, SC

> NiMH batteries can be trickle charged.

To achieve maximum capacity and service life, NiMH cells should be rapid charged rather than slow charged --- in a charger designed for their needs. Temperature sensing is of the utmost importance for proper NiMH cell charging.

The Maha MH-C777a Universal Conditioner/Charger is a remarkable unit - WITH temperature sensing - that differentiates between NiMH packs and NiCd packs automatically. I use mine daily for FT-50/VX-10-compatible battery packs.

It, too, retails for fifty dollars.

4537. Kenwood 733

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-16 00:00:00 UTC
From: Ed Cifelli <r37809@email.sps.mot.com>
Message-ID: <35FFC510.79A4F16B@email.sps.mot.com>
Source record: 131834

Question: I have had a TM733 for a couple of years, buying it new. I am curious if the problem I have been having is isolated or anyone else has had a similar problem. Let me start by saying I live in the Phoenix AZ area where it gets to 110 in the shade outside and hot enough inside the truck to make the LCD thermometer turn black.
The removable face plate of the 733 gets loose during the summer. It is not remotely mounted. If I hit a bump, the radio has turned off and then back on, sometimes the frequencies revert to zero. (i.e. 440.000 on UHF). Kenwood can't help me as it is out of warranty and they agree they probaBly can't duplicate the problem. It doesn't get hot enough in Cerritos. Just curious if anyone else has has a similar problem. I know the cure, I just don't feel like having to spend the money to buy a remote head mount

4538. Help please. FT3000. How to increase deviation?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-16 00:00:00 UTC
From: John@datasafe.demon.co.uk
Message-ID: <35ffd5e2.12849560@news.demon.co.uk>
Source record: 131835

I have an FT3000R attached to my packet TNC. The DEV of the transmitted packet is very low and I would like to increase it. I am told that this needs to be done in software - in other words returned to vendor!

Is it possible to get hold of this software to complete the task at home?

The TNC is a KPC4. The output of this appears to be okay.

Regards

John

On Wed, 16 Sep 1998 02:28:08 GMT, wf3h@enter.netxx wrote:
>there will, i think, always be room for hams because
>
>1. we are immediately on the scene

Unfortunately, we usually aren't. Because only 0.2% of the population are amateurs, while about 25% of the population have cellular phones, the odds are about 100:1 against an amateur being the first communicator on scene. Even CBers are thicker on the ground than are amateurs. (Of course one trained communicator is usually worth several untrained communicators, but that one has to be on scene before his training can do any good. Having more amateurs, and more amateurs with emergency response trainng, would help this situation.)

>2. our systems are decentralized and less prone to being wiped out
>than cell towers, etc

I'd hazard that 99% of amateur towers, and amateur repeaters, are less well engineered than cellular towers and cell sites. And since there are so many more cellular towers, the cellular system can tolerate more downed towers than amateurs can. The cells just automatically get bigger, due to the surviving sites commanding the phones to higher power, when some of the towers go down. The system in effect just reverts back to the way it was before it was fully built out. Coverage becomes a bit spotty, and capacity is reduced, but probably still exceeds the surviving amateur coverage and capacity by a large margin.

>3. we often have back up power

So do the cellsites. In the central business districts, cellsites may only have battery backup due to the infrequent outages. But in suburban and rural areas, cellsites generally also have generator backup for the sorts of longer duration outages often experienced in those areas. This makes cellular somewhat vulnerable in the CBD, but since CBD power restoration usually has a high priority, the batteries are usually sufficient to keep the system up. And some CBD sites have independent power capability anyway, IE many larger buildings have some sort of emergency generator system, as do most broadcast sites. Cellular facilities are often co-located on these sites and benefit from the pre-existing backup power systems.

>4. we can handle traffic that would overload emergency communications

By delaying it. We don't have the traffic capability of even the least of the commercial systems. When *we* overload, the messages back up at the originating station, waiting a turn to feed them into the amateur traffic

system, or at other station bottlenecks in the relay system. In most disasters, H&W traffic piles up until there is a backlog of a week or more in passing the traffic. Often, the disaster is over and the parties have contacted each other by ordinary commercial means before the amateur traffic is finally delivered.

Of course each amateur can prioritize the traffic he has, holding the traffic of lesser importance while passing that with a higher priority. But amateurs generally aren't well trained in this sort of message triage, and tend to want to move all of *their* traffic as rapidly as possible without much consideration for the effect of that on other stations with priority traffic. For example, in the aftermath of the Mexico City earthquake, the 20m nets handling messages in and out of Mexico City too often sounded like a Dx pileup rather than an orderly emergency net. This made the net useless for passing any traffic for many minutes at a time. Better training is needed to deal with this.

Cellular has the priority number system which allows phones with priority ESNs to capture the network away from lower priority phones automatically. When key emergency response personnel are assigned priority number phones, they can get through despite the general public's calling frenzy which clogs the cellular system for the general public. This system proved robust and effective during the Atlanta Olympics, and in the aftermath of the Centennial Park bombing.

>5. we are mobile and have great flexibility. emergency services focus
>on hospitals, security, etc. hams can cover a wide variety of
>responsibilities.

Indeed, we can be additional eyes and ears in the community. But unless we are properly interfaced with the responsible agencies, that isn't of much value. Some amateur groups have effective interface plans, many don't.

>6. there are lots of us

But as noted, not nearly as many of us as cellular users. What sets us apart from the general public cellular users is that we have some training, though in reality most of us have much less of the right sort of training than we should. Those of us with ARES, Skywarn, NTS, etc training, can be better spotters and better message relay assets than John Q Public with a cellphone. But too few of us have that sort of training.

>7. we are members of the community and are often more accessible than
>the focused emergency service members

Most of them are members of the community too, and unlike many of us, they are well trained. Amateurs have the potential to be valuable emergency assets to their communities. But most amateurs need better training, or any training at all, in order to do so. Our ordinary day to day operations don't provide us with much useful training, and some of the activities in which we engage actually instill habits which are harmful in an emergency communications situation. We need to do a lot of work in this area.

By the looks of the messages about the RS-746 "Official ICOM" software and some of my own testing ICOM has pulled a iBOM has done a "Pufter" on us again.

Having played with control software from the day "one" I find it SHOCKING that ICOM and the "Software Gang" have put out such crippeld software, mind you it looks "Greate" but lacking re-sizing ! (like gang its windows basic's)Ok Ok so I am picky. But the Shock of Shock's was that the MEM Locations are not writeable to the radio and you are not abel to read them from the radio, COME ON GANG, smell the roses.... Even the most BASIC CONTROL SOFTWARE for the TS and FT Rigs WAS and IS ABEL to do this, ITS WHAT MOST of US Users USE the SOFTWARE FOR to load and change the INTERNAL RADIO MEM LOCATIONS.....

Golly, I have had the ability to do ALL of the FUNCTIONS that ICOM Left out on my 5 Year old Windows TS-850 Software , and then it was $20 shareware, and worth every dollar.....

THIS MUST BE SOME FORM OF $79.00 "DEMO" and we will have to pay them even more MONEY to be abel to performe the functions,look at it as the ICOM version of PAY PER FUNCTION SOFTWARE.

73,
Steve

I would go lightly, bigfoot. Unless there is a warrant for his arrest,

you could be looking at a "defimation of charactor" or "slander"
lawsuit yourself. remember, Innocent till proven guilty.

I DO agree the guy is a scab.

Used to have one, but too long back to recal. The battery is basically
for hold op of programed memories, etc. If its dead, then you lose it
all. However if you keep power on, it will be retained, of course.

Since you said it had been sitting around awhile, try this. Turn it off
Remove the head from the body of the rig. Take a pencil eraser and clean
the contacts and try to reseat it and see how it does.

I just bought a PK-232 which still has the original firmware in it (June of 1987). I am hoping that someone has upgraded a PK-232 and kept the old firmware EPROMS. I would like something new enough to support the MBX mod, but other than that I do not care what release it is. Can anyone help me out? Thanks. 73

I've gone to many hamfests and computer swapmeets over the last dozen years.
I've bought a LOT of stuff.
I don't know if I'm just getting old, but it seems like more people are becoming
more
adept at looking you straight in the eye and misrepresenting their equipment.
We used to call that lying.

Your strategy at a swapmeet depends largely on your ability to fix stuff.
If you're skilled at repair in general, have experience with this exact rig,
have access to documentation and spare parts, have the expertise to substitute or
make parts that are no
longer available, and have a lot of time on your hands, you can have a lot
of fun buying and fixing used gear.

If you don't have all of the above, or if you send your rigs to the service center
for
repair, you should stick to new stuff, or buy from someone you know well.

I found a power meter head at a swapmeet. It was marked "Dead $15". I watched
someone buy it for $5,
take it to his table and change the sign to "works good, $100". I walked over and
started asking questions
about the head. If I had been in the market and not seen it earlier, I might have

bought it. He was good!
This is NOT an unusual scenario. I've seen this guy at EVERY hamfest since. I'll never buy
anything from him.

Rule number one: It's always broken. Your job is to determine exactly what is broken and
how much it will cost to fix. Ask many questions about the rig. Don't ever believe everything you hear,
but you may find clues that will help you get at the truth. Listen especially for what is NOT said.
Remember that your president is not the only one who is capable of obscuring the truth. Ask, "does the rig
work 100% here, now, at this moment". "How/When did you test it?"
Look for any evasiveness. "It worked last time I used it" is not an adequate answer. It may have been dropped, been in a flood, hit by lightning etc. "It belongs to
my buddy and works great", and "came from an estate sale" are other non-answers. If the seller can't convince
you that he has personally used the rig in the last week, you are at high risk. Anything marked "AS-IS"
or "removed from working equipment" or "not tested" or found in a big box under the table is suspect.

If you get to the truth that an item is defective and overpriced, make sure the seller understands that you and
he both know the true condition. He can no longer be evasive. He has to outright lie to a prospective buyer.
That's harder for most people to do. You may save the next prospective buyer some grief.

I once found a scope plug-in. It was marked "works good $100". I asked why he was selling it. "I don't have
a mainframe". "How do you know it works then?" I guess he was unprepared for that question. I bought it for $10.
It was indeed broken, but worth every dollar I paid for it.

Remember that what it will cost you to fix it sets the UPPER limit on what you'll pay. You need to also consider
the fix cost for the next-highest bidder. You may think you know what's wrong and have the part. The other
guy may have to send it to the service center. He won't pay much. You shouldn't either.

Rule number two: Test it. A prepared seller will have the means to demonstrate the item. A prepared buyer
will also take the means to test the item he's looking for. The bad news is that a quick check may not
tell you what you want to know. The rig may have poor sensitivity, low output, intermittents, missing
functionality, etc. that you may not discover until you get it home and run it thru all it's paces. If you're not

experienced at evaluating equipment, take an experienced person with you. Ask for a money back guarantee
and make sure you can find the person later. You won't find a "real-deal" with a money back guarantee,
but it's still worth asking.

Rule number three: It's priced at or above it's value. Yes, there are some truly good bargains to be found
at swapmeets, but these usually get bought right off the cart as it's being loaded in at 5AM. Dealers get in
before you do. They buy up the bargains and mark up the price. Some will be evasive. Others will tell you it
works great, even though they have no idea what the real condition is.
If it's for sale when the doors open, it's probably not a great deal. Remember, a fully functional radio will
command a higher price than one with problems. If it were cheap to fix, it would be fixed and priced at market.
Typically, fixing that minor problem will cost you more than you saved on the broken item. There's a lot
of equipment, old and new, that's made out of "unobtanium". In many cases, you can't even find out
who made the part, you can't get documentation or it takes special equipment. This is especially true of
laptop computers. If you're in the market for a computer, take a diagnostic diskette with you.

Some people worry if equipment looks too good. I find this not to be a reliable indicator. I always shine
up stuff that I take to a swapmeet. Good looking equipment is easier to sell.

Take real cash money and waive it around while you're negotiating the price. The seller knows that it's just
as easy for you to write a bad check for the $600 asking price as it is to bargain him down.
Never offer the asking price. There have been a few times that I've pissed the seller of so bad that
he wouldn't talk to me any more, but that's rare. You can usually get some reduction. Asking is free and
a lot of fun. Make 'em squirm.

Rule number four: Don't get excited. Almost every time I've been really screwed, it was because I got excited
over the deal and ignored the warning signs. Any item that's still there after two hours will probably not sell
at the asking price. It may take longer for the seller to admit that to himself. The longer you wait, the better
chance you have of getting a lower price. Don't be afraid to offer 10% of the asking price. Sometimes it takes
you all day to get it. The worst that can happen is that you have to cart it home. Don't you just hate it when
they call your bluff. If you don't get what you want at your price, go to the next

hamfest and try again.

My bleak picture of swapmeet equipment quality is due, in part, to the fact that I don't deal in the mainstream
stuff priced at market.
I seek items that are the "deal of the century"; and I have a great time doing it.
I'm sure the majority of swapmeet sellers are honest and have
good stuff for sale. Your only problem is to determine which ones. Buyer Beware...

Sounds like FT-243 holders. I think it was "P-R Crystals" that were
made in Sandwich? (quite a few companies made compatible units)

They were popular in military gear during WW2, and with amateurs into
the 1960s. There's still some market for those falling within HF
amateur bands, for use with nostalgic equipment. Name the exact
frequencies, and someone may (or may not..) be interested in buying
them. I know if you have anything between 440 and 470KHz, I might be
interested.

4560. TS-50 vs IC-706 Noise Blanker

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-16 00:00:00 UTC
From: nw2m@qsl.net
Message-ID: <6tpetq$4e6$1@nnrp1.dejanews.com>
Source record: 131857
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Had the opportunity to to try the TS-50 and the IC-706 on our yearly trip to the Dayton Hamfest. We used the same van and antenna. The TS-50 eliminated an S7 spark plug noise to almost zero. The IC-706 had very little effect on the same noise.

I am very glad to have the TS-50 for mobile operation. Others have reported the same results. I am working on a shielded ignition system to reduce the noise regardless of the rig. These high ignition/fuel injection systems are tough!

YMMY,

73, Al

Unfortunately, it is a little more complicated than that. When AEA went to the MBX firmware, the software grew larger than the original EPROMs. They went to a "daughter board" that plugs into the old EPROM sockets and hold the new EPROMs and RAM.

I sold my extra daughter board recently (from a defunct 232 -- I have 2) so can't help you directly. However, Timewave still supports the 232 and you can get the daughterboard and E-Proms from them. Look at www.timewave.com and select amateur products.

cheers.

: Help!

: I bought a clean Azden PCS-3000 at a hamfest over the weekend. It worked
: fine at the show, but when I powered it up at home, the processor seemed
: to be locked up -- no RX or TX, and several odd characters on the
: display.

: The sticker on the radio says, "if microcomputer malfunctions, see page
: 12 of manual to restore normal operation." But part of the reason for
: the terrific price on the radio was the lack of the owner's manual.

: Various efforts at button-pushing combinations and ways of turning the
: radio on and off (with my nose, my toes, etc) haven't been successful.
: Anyone out there have a PCS-3000 or know how to reset one?

: Also, the ham I bought it from retired it more than a year ago when he
: bought a new mobile, and the memory battery is dead. Is this why the
: radio locked up now?

Maybe - it might just be due to the dead/poor memory backup battery.
You *do* need someone with the manual to give you the *exact*
reset procedure. My PCS-4000 is similar, I believe, in that you need
to remove one of the covers; unplug the battery; short two of the PC
board connections where the battery plugs in; and turn it on - then off.
Or the somesuch.
It ain't done by fiddlin' with the front console controls.

Good luck es 73

>too.
>

there will, i think, always be room for hams because

1. we are immediately on the scene

2. our systems are decentralized and less prone to being wiped out
than cell towers, etc

3. we often have back up power

4. we can handle traffic that would overload emergency communications

5. we are mobile and have great flexibility. emergency services focus
on hospitals, security, etc. hams can cover a wide variety of
responsibilities.

6. there are lots of us

7. we are members of the community and are often more accessible than
the focused emergency service members

4580. TM-201A Mods?

Is it possible to expand the TX range of a Kenwood TM-201A? If so, could someone please point me in the right direction. I need to be able to transmit in the 155MHz range. It would only be used in rare occasions. The Sheriff's Dept I work for has a fancy 800MHz trunked system, with all the bells and whistles, but without the ability to speak to our State's Highway Patrol officers. Any assistance would be appreciated. I'm trying to avoid buying a seperate radio just for being able to speak to the State guys about once or twice a year.

> charged....the battery cannot be charged separately (as it can with my
> FT411).

Why? I see no reason why it can't be charged off the unit. If you look at the bottom of the battery in the recesses you'll see the conatcts where the battery can be charged.

Good luck!

I have the previous model, the AT-200. When the light goes out the batt is charged. If you leave it on longer it will overheat. Don't let it over heat. That will affect batt life. An option is one of the auto chargers that MAHA sells which stops charging when you have a full can. Hope this has helped

Both bands should function equally well for either situation in a line-of-sight propagation type environment. However, transmitting simplex, your range/distance between xcvrs will be much more limited. If range is a consideration, 2m may be a better choice due to the propagation characteristics of UHF. At least this is my understanding. A more experienced ham can probably give you even more information, and further educate me as well.

4602. Re: ICOM RS-746 Control Software for IC-746

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-17 00:00:00 UTC
From: djaffe@my-dejanews.com
Message-ID: <6tq6md$tm4$1@nnrp1.dejanews.com>
Source record: 131740

Is this a limitation of the icom software, or a limitation on what the
hardware is capable of conveying? That is, could someone else write
better software, or is the information just not provided by the radio?

Thanks for the info--

David Jaffe

>that all these "shootout" heavy metal dudes would be on the ham bands
>****LEGALLY**** if not for the dreaded and dastardly Morris Code
>requirement for getting a license?

Hahahahahahahaha That's really funny. Care to site *ANY* credible
evidence to support that outrageous claim? The history of CB
is clear on the matter and Morse Code *NEVER* had anything
to do with CB going from order to chaos. Idiots like you believe
that your "skill" in Morse Code somehow measures your behavior
on the air. Well, listening to your buddies on 20 and 75 meters
would indicate otherwise.

> Once licensed and here, what's to stop them
>then??? FCC enforcement??? Have you not heard of them making
>that very statement??? Crawl out and look around--and listen up.
>If you truly value the ARS as you claim, and are not just some Hi-Tech
>troll-puppet, you WILL understand what this means.
>Go find the website where the "CB Channels" are all listed. They run all
>the way from Channel 1A at 25.165 mcs to Channel 40J at 29.655 mcs!!!
>What do you suppose they plan to "do" with the ten meter band???

Are you really as stupid as the above makes you appear? If the
FCC isn't doing enforcement, what makes you think Morse
Code (an FCC requirement) is keeping *ANYONE* off of
our bands? Either someone is a lawbreaker or they aren't.
Why would a law breaker care about a license or any FCC

requirement such as Morse Code. Are you really so dense
you can't understand that?

73,
Todd

4616. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-17 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6tqcov$lha@news.Hawaii.Edu>
Source record: 131754
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

> an ALPHA!! But for the cost of an Alpha I can get two nices horses and a
> trailer, plus some ham gear!
>

The 8877 has a very extended frequency coverage and I've seen them be
very temperamental on VHF due to the close proximity of grid and
cathode. Glass/metal hermeticity is also reckoned to be somewhat better
than ceramic/metal sealing, so the 3-500Z's would be my choice based on
price and operating/non-operating life expectancy if I wanted to build a
big amplifier.

2 horses => 2 horse power => about 1500 watts output ;-)
Coincidence?

Cheers
David GM4ZNX (who once bagged the local club's dressage
championship)

The Galaxy V Mark 2. The lunch box rig. If memory serves me correctly, I paid 50.00 dollars for mind back in 1988. Replaced 123 resistors that carbonized. The paper capacitor blew out on the audio board killing the 12BA6 tube. However, once I got it working it did an excellent job. On 80 meters, it put out approximately 500 Watts PEP. However on 10 meters, it was pretty worthless A measly 100 Watts.

The last time I used it, I turned it on to warm up, went to the Kitchen heard a loud zap and I decided to put the Galaxy to rest. When I get time, I will probably look at it again.

I would not paid more than 15.00 bucks for one today. 6HF5s very expensive HI HI.

4623. Re: Emergency Communication - Ham vs Cell

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-17 00:00:00 UTC
From: Riku Kalinen <riku.kalinen@xxnixuxx.fi>
Message-ID: <3600EE7F.3DB9EB14@xxnixuxx.fi>
Source record: 131761
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.policy

Gary Coffman wrote several good points referring to WF3H's article.

I would like to add some points to the discussion from local (Finnish) point
of view:

As you might know, in Finland cellular penetration is now slightly more than 50%. In some cicrumstances, however, cellular phones are not really attractive wholesale communication solution.

1. Search and rescue operations in rural areas (there are LOTS of these here).

In rural areas, the cellular coverage is usually quite poor and capacity
of the base stations is very limited.

In these situations we are usually forced to use whatever we can mobilize
fast. This means mostly simplex radios (Red Cross VHF ~68 MHz and ~160 MHz,
ham radio gear, whatever). Usually hams are best equipped to handle, install and operate these kinds of makeshift networks.

In many cases, sufficient infrastructure (eg. base stations) simply is not
available.

2. Mass events (e.g. plain crashes or rock festivals which draw lots of people on scene).

Pracitice has shown that our cellular systems are not capable of handling these kind of traffic peaks. Or, shoud I say, the cellular operators are not able (plain crash) or willing (rock festival) to add necessary extra capacity to the network for short-time traffic peaks.

Priorizing calls is great solution to this problem, but it requires some
work prior to the event and sometimes this is not done.

Cellphones are, of course, very important backup system and we use those extensively (practically everybody has one).

Especially GSM network has one VERY valuable feature: Encryption. This is quite hard to achieve using other networks and standard tools.

I tried it with the JPS Noise Eliminator. Installed a great receiving antenna in the engine compartment. I had 2 different noises that I was trying to eliminate. First was fan motor noise from a Bosch Fan on 20 meters. Did not help. Second was spark plug noise on 40 meters, Did not help. I spent hours and hours on this project with the help of tech help at JPS and other knowledgable folks and finally returned the unit. Happily (for my hamming) I have a new car without those problems.

And the reply is too good to pass up also. Perhaps Ford is making a few bucks two ways. They have a "fix" for the problem but it is a bit pricey for those of us who view ham Radio as a hobby - about $60.00 to $70.00 for their filter [I've seen one, it looks like it might contain a capacitor and a couple coils, fancier than the capacitor only idea, but maybe a little better - it mounts inside the tank.] and I was quoted about $175.00 to install it. Perhaps, if the vehicle is in warranty, they will install the retrofit for free, I don't know.

So if you go to a Ford dealer after the warranty runs out, they make a few extra bucks on the retrofit. The majority of the people buying cars and light trucks will not know about the fuel pump noise problem since they don't put radios in their vehicles - so Ford gets to save a little in manufacturing costs.

Yes, it has been a long time. My Ranger is 8+ years old and I know of people with newer Ford products who have experienced the same problem. Don't know about the newest Fords though...

73 to all,

Wayne

GE Master II radios 144 to 160 Mhz.

Some have PL encode/decode 100.0/146.2

50 Watt transmit .5 uv or better receive. (ALL WILL BE CHECKED BEFORE

THEY LEAVE HERE THERE WILL BE NO DUDS).

Some may come tuned in the ham band as I have done this to a few to make

sure they work well there.

Currently on Goverment frequencies but tune to 2 meter ham verry easy.

Each package contains:

One radio.

One control cable.

One control head 8 channel.

One microphone.

One speaker.

One transmit/One recive ICOM without crystals.

One PL incode/decode board and hook switch as available.

If you buy 5 or more (limit 25 as that is all I have) you

will receive a compleat service manual.

The cost is 75 dollars plus shipping FIRM!

Crystals can be installed for one frequency tx/rx for 40 dollars.

You are responsible for any additional ICOMs and crystals as there

are not enough to do more. If you order the one channel installed

you must wait 4 to 6 weeks for me to order the crystals from my supplier

and them to ship them to me. The time can be shorter but the

supplier raises the price to me and I to you.

If you want to order your own crystals and install them your self

you can order them for 10 dollars each (20 dollars a pair 1 tx / 1 rx)

from:

Hy-Q International

1438 Cox Ave.

Erlanger KY. 41018

606-283-5000

COD or money orders only no credit.

DO NOT buy JAN or BOMAR crystals as they are shipped off frequency

and usualy fail within 6 months.

Any repeater mods you want are up to you to do.

All orders and shipping are to be handled through Rich KA8CMK at Big_Red_One@Juno.com

way he want's to do it.

Thank you for your time

Wayne L. Anderson

>Impressions ?

There have been a number of good reviews of the W32 on rec.radio.amateur.equipment already; you can find them using www.dejanews.com or an equivalent archive. These answer your questions about receive ranges and mods; I shall offer only a few comments which I do not recall having previously read.

Scanning is at approximately 10 frequencies per second.

Memories are divided between UHF and VHF; you can't store UHF and VHF memories in the same memory bank like you can on some radios. (as there are two VFOs, however, this shouldn't be a problem for most purposes)

The microphone wiring is annoying if you don't buy off-the-shelf microphones.

The transformer which comes with the radio is lousy - mine outputs a .22v peak-to-peak sawtooth wave at 120hz on top of its DC output. This causes the CTCSS detect/transmit to *fail to operate correctly* while the radio is connected to external power from this adapter (this is correctible with a ~$1 voltage regular inserted in the line, however, or by using a better power supply)

The W32 offers simultaneous UHF/UHF and VHF/VHF receive. However, the range of one of the them is small - in UHF, one of the VFOs has an extended range, but the other is 435MHz to 455MHz only (or 425MHz to 445MHz if you're using the European bandplan). You may or may not care, depending on what you want to do.

The computer connection works fine for programming, but adds no additional functionality (you can't hack on the radio with it like you can with Yaesus; frob anything and it just balks and resets).

The alphanumeric memory function is set up so that you can't view the name and frequency at the same time, just frequency and memory # or memory # and name.

Cellular images appear somewhere around 950MHz. This may be good or bad dependong on what you want (probably bad for most purposes).

"key lock" doesn't lock *all* the keys; power, high/low transmit power, light, squelch, and possibly some others continue to operate.

This may or may not be a feature, depending on what you wnat.

The labelling rubs off of the keys easily if you don't keep it in some sort of case.

The instruction manual is less clear than one might like, but is adequate if combined with a little bit of intuition.

Overall, I'm not dissatisfied with it, but I'm not convinced that it's necessarily the best radio in its price range, either.

-Terran

Hello, here's 3 questions I would like to be helped with:

1. Is $250 a good price for a Sony ICF-SW7600G?

2. Does someone know any frequencies of particular space missions/satellites/sonds?

3.Is it possible to homebrew a unit which could expand a normal AM frequency range (150-30000 kHz) to 100-300 MHz or more, so that it would work by connecting it to a normal worldband radio?

I appreciate help. Please return a possible answer to bartalzo@hem2.passagen.se, as well. Thank you.

Greeting from Zoltan, a VERY beginner radio-amateur whose knowledge in radiotechnics and electronics is VERY limited.

I have the R8500 Icom control software and you can modify the memory
locations.
You can also read and write all 1000 memories and modify the memory text
field.

You can't access the database file, and you can't get a print out of the
memories.

What type of key is it? If it's like the keys I have seen on the USS Hornet or USS Pampanito they are a simple strait key. Not worth that much as keyers go $10-$20... Unless you new it was from a particular ship and had documentation it might be worth more to a collector. I have seen some US Navy Vibroplex Bugs the say US Navy. That would be worth at least $100 maybe much more.

Hope that helps,
Don, W6IQ

> to spend the money to buy a remote head mount

I have had the 733 since it came out. I have experienced several
problems with it mostly during the first 2 years I had it. Now that its
5 years old, the remaining problems are as follows:

If I press the power button to shut the radio off too quickly, it can go
into a kind of limbo mode where it wont come back on. I find that if I
take the faceplate off the radio, wait 10 seconds, put it back on, it
will be back to normal. The faceplate doesnt really get sloppy loose in
my unit, but it does get "looser" in the heat. Maybe you could use a
pencil eraser on the 4 spring loaded contact pins. That would be my only
guess there.

It also gets quite hot at 50W and during the summer (Ohio) will
routinely shutdown the power amplifier if I xmit for more than 10
minutes or so, like 3 minutes on 3 minutes off. Its not in the sun
either, its in the center console of a truck. In my opinion it just
doesnt have enough heat sink mass. Annoying but I can live with it.

It is not the most rugged radio, but it has several real nice features.

Tim

I doubt it. I have the predecessor TM733. The personality of the radio
is in the faceplate,
like all the memories, mode, squelching etc. If you remove the faceplate
the radio turns
off. I assume this is the same on the TM-V7

>missions/satellites/sonds?

My home page has a list. Also go here:

http://www.amsat.org/amsat/sarex/shutfreq.html

But just to help right now:

Space Shuttle/Mir Radio Coms - As of: 8/23/98

(Sarex is now known as the Space Amateur Radio EXperiment)

Space amateur Radio experiment (Sarex) Downlink: 145.550 FM
This is for both voice AND packet modes. So if you hear short
bursts of noise they are in packet mode.

Some amateur radio 2 meter FM repeaters carry live air to
ground coms. Go here to get a list of shuttle freqs around the country:
http://www.amsat.org/amsat/sarex/shutfreq.html
If your in the NYC metro area try the W2FCL repeater in Northern N.J.
on 146.610. I pick this repeater up from about 100 miles away easily on an
Icom 2000H and a Ringo Ranger vertical up about 27 feet.

On HF, WA3NAN - the Goddard amateur radio club
re-transmits the missions on: 3.860 LSB (all freqs. in single side band)
7.185 LSB
14.285 USB
14.295 USB
21.390 USB
21.395 USB
28.650 USB

These are dependant on propagation! In South Eastern N.Y. I pick them up on
the 80 and 40 meter frequencies (the first 2) the best.
They I.D. in morse code and voice. Park on a freq. and listen awhile,
coms are not non-stop! There are sometimes long breaks in the action.
When the astronauts are asleep they are off the air. If the weather is
bad at the station or no control operator is available they won't be
on the air either. This is a volunteer service. Thanks to WA3NAN for
providing this service!

Mir 2 meter FM amateur radio downlinks are currently on 145.800 (Europe)
and 145.985 in the U.S. These are for both voice AND packet radio.
So if you hear short bursts of noise they are in packet mode. They are
in packet mode most of the time, especially after 2000UTC.
(their 8 hour sleep period)

There is a ground control freq. of 143.625 FM that is sometimes
used as well, but NOT for amateur radio. I hope you speak Russian!

Mir is also now on 70 cm with voice downlinks on: 437.950
437.925
Packet downlink: 437.975

Happy listening!

Not so. The Heath Cantenna kit did not come with any oil. I used mineral oil for a number of years, but this was only a stop-gap solution. Was finally able to replace the mineral stuff with non PCB transformer oil.

Anyone using the fairly new Yaesu FT 8100 dual bander? If so, what do you think. In the market, but have seen no reviews on this radio.

Tnx.
Les WD5BYQ

4670. Mot GP68 for Ham use, Comments

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-17 00:00:00 UTC
From: Nancy and Tom Marcotte <marcotte@iamerica.net.nospam>
Message-ID: <6ts46j$873$1@news1.iamerica.net>
Source record: 131808

Remove nospam for replies.

My Kenwood HT broke (twice, expensive to fix) and so I set out looking for a more durable HT. I recently purchased a Motorola GP68 (VHF), and wanted to give some thoughts/opinions on this rig for ham use.

General

Motorola intended the GP68 to be used for commercial purposes in markets such as South America and Asia. As far as I know, it is not offered "officially" in the USA.

RX/TX coverage is 136-174 Mhz. No modifications are required, except that to keyboard-program the radio, one must have the dealer programming instructions (ask for this when you buy).

The rig has 20 channels, each of which may be configured with PL or DPL (transmit and rec), simplex freq, standard offset (+ or - 0.600 Mhz on VHF) or odd splits. In the normal user (commercial) mode, each channel is labeled by channel number, not frequency or alpha characters. PL and DPL are labeled by tone code, not tone frequency.

The rig can be operated in one of two main modes, user or dealer, and this is where the ham operation features are important.

When in the dealer (program) mode, you can program frequencies and PL's for any of the channels, or operate in a sort of VFO (Motorola calls it "Mhz") mode on the fly. I was told this was not possible, but actually, it is. It will TX and RX fine in the dealer/VFO mode. The radio actually becomes pretty ham friendly if you know what to do . Simply leave it in the dealer mode, and you can click to, or scan the preset channels, or you can dial in, punch in, or scan VFO limits. Offsets and tones can be set in this mode as well. So if a buddy says "meet me on 147.550 with a PL of 100" you can do that pretty quickly without programming this frequency into a channel slot. You can operate from the dealer/vfo mode. Another example, if you want to receive the weather on 162.550, it is not necessary to store this in a channel slot, just punch it up in the VFO and it will come in.

VFO Scan

This also caught me (and my dealer) by surprise. By entering scan limits into channel slots 19 and 20 in the dealer/VFO mode one can do a VFO scan between these limits. For instance, to 2M FM, enter 145.000 or so into channel 19 and 148.000 or whatever into channel 20. Set step size as desired, and press scan. The scan button is intended to scan the preset channels when out of dealer mode, but works quits nicely in

dealer/VFO mode between scan limits of channel 19 and channel 20.

Scanning of preset channels (the primary scan role) can also be done, with a lockout feature for nuisance hung channels.

Durability

While the radio is designed and constructed to MIL spec something or another, one should not confuse it with the premium Motorola rigs carried by police and fire fighters. You should not attempt to drive a nail with this radio, but as ham rigs go it should hold up as well or better than the IckenZoo's. I think it will do fine in the rain. It is smaller than the typical Motorola commercial rig, which makes it easy to carry. Mine came with the 1200 MAH battery.

Summary

The GP68 can make a nice, sturdy ham rig. I would not take it into a fire or gas plant, however. It is not of the construction of the premium Motorola rigs, but I think it should TX and RX just as well.

Pros

Sturdy, name brand, pleasing industrial design as with most Motorola products (except the R-390!). 5W, high battery capacity, keyboard programmable, PL/DPL encode/decode built in, loud sound, good value IMHO ($269), good rec and tx performance, as good as HT-600, charger is of desktop variety.

Cons

Fewer memories (20) than most ham rigs. No aircraft (naturally), user's manual is in Spanish/Portuguese (mine anyway) but programming instructions are in English, programming not as easy as ham rig, ant is not BNC, not sure of ant center frequency, probably about 155 Mhz, no 12V DC input, can't see what the frequency is in the user mode, only channel number.

Since I am only a casual HT user and don't diddle with bells and whistles too much, the pros outweigh the cons for me.

If you want SSTV and a built in video game, this rig is not for you.

I may get a second one. We are a three ham family.

Your mileage may vary, etc, etc.

Bonne chance
Tom N5OFF

4671. Re: IC W 32 ht, ANY GOOD ?? what's the rx range any mods ?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-17 00:00:00 UTC
From: Rick Pemble <pemble@ix.netcom.com>
Message-ID: <6ts67h$cvu@dfw-ixnews8.ix.netcom.com>
Source record: 131809

I recently bought one and love it. I use it for scanning more than ham ht.

two mods that are interesting:

hold Squelch key and Band Key for 5 seconds while power is applied will open
up receive freqs to 300-999MHz on the UHF side.

for cross=band repeater
lock keyboard, then power off
SQL+MAIN+BAND+POWER ON
Unlocke keyboard to revert to normal

the first I have done and works great. The cross band repeat was posted to
the newsgroup and I haven't tried it yet.

I read the reply to your post which was pretty interesting. The points I
would say that I "wish were different" is the "lock" key -- it really should
lock the keyboard - and dosen't, and it would be nice to have freq and
alpha on the same display. Oh well.

I still like it a lot.

cheers

Rick W4RP

I have a '98 Ranger that has hellacious ignition noise and other vehicle noise. I
haven't looked close enough to see if any is comming from the fuel pump. It even affects the AM side of vehicle stereo system. The dealer says it may be a bad radio.

Naturally, the dealer says Ford has no bulletins or recalls on this problem. If anyone knows of any, let the rest of us know.

To All,
Does anyone have experience in using the SM-8 with other than ICOM radios? Tried it with a Kenwood TS700A and it sounds terrible. Can't get any adjustment to sound even tolerable. I do have 9 VDC applied to the correct pins.
Bought it for use with an ICOM 726. Anyone have any comments as to what has worked well with this radio? Anyone tried a Heil cartridge with the Heil ICOM preamp? My thanks in advance to those who respond.

>
>HT simplex communiation?
>HT with a repeater?
Although there are exceptions to everything, In most areas you will find
that you can "hit" more 2m repeaters with the HT than 440 ones. Also in line
of sight simplex conditions, a 5w vhf signal should go a little further (mabey
a few Rat hairs worth) than a 5w uhf. Good luck!!

Hf station for sale consisting of the following items:

Kenwood TS-440SAT HF rig in near mint condition. Includes 1.8 khz narrow SSB filter.
Comes with hand microphone, instruction and service manuals. Also original factory box. Works perfectly.

Kenwood MC-60 desk mike in mint condition.

JPS NIR-10 noise reduction unit with version 3 and 4 firmware chips. Excellent
condition with manual and all cables.

Daiwa CN-101L SWR/POWER meter brand new. Covers 1.8 to 150 mhz and up to 1.5 kw on 3 scales. Has cross needles and shows PEP and AVG power.

Home built trap dipole with 6 traps. Resonates on 80, 40, 20 and 10 meters but can be used on other bands with a tuner. Only 62.5 feet long and designed
to work at 30 feet high. Designed by the U.S. army and built during our last field day. Very hot on 20 meters.

Asking $1000. U.S. for the lot including shipping and insurance.
I would consider selling individual items, prices to be negotiated.
Inquire by email if you have questions or offers.

for an area wide emergency we cant help be on the scene since we live
in the affected area

>
>>2. our systems are decentralized and less prone to being wiped out
>>than cell towers, etc
>
>I'd hazard that 99% of amateur towers, and amateur repeaters, are less
>well engineered than cellular towers and cell sites.

except that experience doesnt bear this out. there is a wide diversity
of towers which have amateur repeaters. 'average' is not 'median' and
with the number of amateur repeaters being several thousand at least
one is usually available as the kauai hurricane proved 4 or so yrs ago
when amateur communications were the only form for a few days.

And since there are so
>many more cellular towers, the cellular system can tolerate more downed
>towers than amateurs can.

except that anyone who's used cellular systems knows how spotty the
coverage is. in fact, outside of metropolitan areas its very
unreliable. i cant even use a cell phone at the philadelphia airport.

Coverage becomes a bit spotty, and
>capacity is reduced, but probably still exceeds the surviving amateur
>coverage and capacity by a large margin.

i dont think anyone who's travelled would agree with this in the
least.

>
>>3. we often have back up power
>
>So do the cellsites. In the central business districts, cellsites may only
>have battery backup due to the infrequent outages

and cell sites get overloaded with traffic and are generally reserved
for emergency use. amatuers are more point to point service used by
emergency services like hospitals, red cross, etc.

>
>>4. we can handle traffic that would overload emergency communications
>
>By delaying it. We don't have the traffic capability of even the least of the
>commercial systems.

i disagree. because we are so few, we dont overload the repeaters in
an affected area. in addition, the 'long haul' hf service is also
generally useful, as my own experience demonstrates. a few yrs ago for
about a week, a ham in the US VI and i regularly swapped health and
welfare traffic for communication to our respective areas when that
area was hit by a hurricane.

. Often, the disaster is over and the parties have contacted each
other
>by ordinary commercial means before the amateur traffic is finally delivered.

except that phone service is generally not available in areas where
widespread outages takes days or weeks to repair. anyone who's ever
talked via ham radio into an earthquake or hurricane affected areas
knows that power and phone service is not routinely available.

>
>

>>5. we are mobile and have great flexibility. emergency services focus
>>on hospitals, security, etc. hams can cover a wide variety of
>>responsibilities.
>
>Indeed, we can be additional eyes and ears in the community. But unless
>we are properly interfaced with the responsible agencies, that isn't of much
>value. Some amateur groups have effective interface plans, many don't.

thats true; each ham club should have an emergency services
coordinator who works with local officials.

>
>>6. there are lots of us
>
>But as noted, not nearly as many of us as cellular users.

and cellular users are not used by the red cross, the MS society, etc
for a very good reason: these are private services which are not able
to cover a wide broadcast area reliably. there's a reason our local MS
society uses hams instead of cell phones to provide service during
community events.

Our ordinary day to day operations
>don't provide us with much useful training, and some of the activities in
>which we engage actually instill habits which are harmful in an emergency
>communications situation. We need to do a lot of work in this area.
>

you bet. every amateur should make an effort to participate in
community services, disaster drills, etc.

I'm not sure if a remote head mount would help the situation....although I live in a certain area where we rarely exceed 100 degrees on the hottest summer day, I sometimes have problems with the faceplate not making proper contact (and I use the remote mount kit). I haven't noticed the problem when hitting bumps, but rather when letting the vehicle sit out in the sun for extended periods of time...when I come back and try to turn the radio on, nothing happens....removing and re-latching the faceplate makes it work again.

I'm not 100% certain this is related to the heat but it's a strong possibility.

4692. FS/FT""Vintage UHF Motorola HT100's"

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-18 00:00:00 UTC
From: jleikhim@nettally.com
Message-ID: <3601d711.9381409@news2.nettally.com>
Source record: 131640

For sale or trade:
If you know what these are you want them!!

I am open to offers.

Pair of good looking UHF Motorola HT100's in great shape, presently on 451 MHz.

Batteries are NG you can probably re-load them with cellular battery cells, or have one of the battery rebuilders work on them. Maybe you can put NIMH cells in!

These are in pretty good condition suitable for the Motorola collector.

And, they actually work!!! You will want to recrystal for your favorite ham freq as these are on two different repeater pairs and do not have simplex. But they do transmit and receive quite well. The insides look very good. No parts have been changed, no torn foil or corrosion.

Oh they also have the tiny factory PL board. PL 5A

Will throw into the deal some Motorola tune up adaptors for HT220 VHF, HT220 UHF and HT100 UHF

Or maybe we can trade for something else??

Message-ID: <6tt1hq$dfa@idefix.eunet.fi>
Source record: 131645

I have 10 months old FT8100R in my car.
I found that
1. There have been a couple of bad connections in the display unit's
SMD components.
2. RFI problems. I had to add ferrite cores to mic line and power
cables. Still having some with problems with 50W power (VHF).
3. Receiver cannot stand near FM BC-stations (90-108 MHz).
I live about 3 miles from BC- and TV broadcasting stn.
Also interference from alternator is very heavy and difficult to to
get rid of it.
4.The rig is running too hot and CPU goes mad very
easily. But that is not a problem when we have winter season.
It is NOT too hot at -30C . HI.

Good thing is that you can take the front panel with you but only
if you do not use separation kit (in that case you will need a
screwdriver).
Also I like the one way repeater feature. It is very nice when you have
VX-1 in the pocket and you have "remote booster" in your car.

I have no experience from any other new rig.

To: daveem@webtv.net Subject: 6.500 relays for sale
I have approximately 6.500 relays for sale to the highest bidder. I will also sell them in much smaller portions if needed. The manufacturer is Potter & Brumfield.
The part # is T90S1D12-12 The ratings are as follows, The case on the relay says,
30A,240VAC
10A,240VAC
15A,125VAC
They are normally open untill they are turned on. Coil is designed for12 volts.It has 153 ohms resistance across it. I have been able to turn these on with as little as .050 M.A. but at 12 volts they will use .078 M.A.
They are printed circuit board type mounts. There size is as follows
Length, one and a quarter inches
Width, one and an eighth
height three quarters of an inch.
they are not a perfect rectanglular shape but close. I can be reached at 541 479 -3915 if I am not in leave a message. Dave Maltz

BIG OLD disk drives. If you don't have access to dead drives,
check the yellow pages for a drive repair place.
Surplus outfits sometimes take them out and sell them.
Edmund Scientific, but they're not cheap.

Hf station for sale consisting of the following items:
Will also consider selling items seperately.

Kenwood TS-440SAT HF rig in near mint condition. Includes 1.8 khz narrow SSB filter. Comes with hand microphone, instruction and service manuals. Also original factory box. Works perfectly. VCO5 problem has been fixed on this one. Asking $700. U.S.

Kenwood MC-60 desk mike in mint condition.
Asking $85. U.S.

JPS NIR-10 noise reduction unit with version 3 and 4 firmware chips.
Excellent condition with manual and all cables.
Asking $125. U.S.

Daiwa CN-101L SWR/POWER meter brand new. Covers 1.8 to 150 mhz and up to 1.5 kw on 3 scales. Has cross needles and shows PEP and AVG power.
Asking $75. U.S.

Home built trap dipole with 6 traps. Resonates on 80, 40, 20 and 10 meters but can be used on other bands with a tuner. Only 62.5 feet long and designed to work at 30 feet high. Designed by the U.S. army and built during our last field day. Very hot on 20 meters.
Asking $50. U.S.

Asking $1000. U.S. for the lot.
All prices include shipping and insurance..

Inquire by email if you have questions or offers.

Hi guys. I had heard of this problem when I purchased mine, about 5
years
ago. When I removed it from the box, I took the covers off immediately
and checked the heat sink grease on the little PA modules. Sure enough,
there was a blob of thick grease in the middle of the module, and then
it
was bolted to the heatsink. A thick blob like that has the effect of
providing thermal insulation, rather than thermal conduction. I cleaned
the old grease off, and put a thin layer of new heat sink grease on, and
it works fine. There are 2 modules that need to be done, one for each
band. Since then, I have purchased 2 other 733s (one for each vehicle)
and a TM-251, and they were all the same. If you're using Kenwood
mobiles, you might check this out.

73.

Jeff

4709. The problem with free running VCO oscillator kits ....

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-18 00:00:00 UTC
From: web_surf@hotmail.com
Message-ID: <6ttoi9$n3u$1@nnrp1.dejanews.com>
Source record: 131657
Cross-posted to: alt.radio.pirate,rec.radio.amateur.homebrew,sci.electronics.design,rec.radio.amateur.equipment

.... is that there is no money for kit manufacturers in them.

If you were a kit manufacturer, what would you rather do ?

A) Make a 1W free running VCO kit costing 15 pounds of parts and sell it for 27

Sell it to a few hobbyists

B) Make a LCD PLL kit costing 40 pounds of parts and sell it for 90 ???

Sell it to hobbyists, professionals, serious Pirates, OEM into other solutions.

Somehow I like the seat-of-the pants, understandable approach of the free-running Oscillator. It uses technology that is comprehensible to most hobbyists and beginners. It is much more cost effective for the 0.5W-10W crowd that likes to experiment with Radio. It allows more people to try their hand at kit construction and learn the basics. It has a smaller knowledge-hill that you have to cross before you feel like making your first transmitter.

The biggest issue with free running VCO designs is that they drift in frequency. Why ??

The oscillation frequency is largely determined by a LC or LC and Varactor circuit, but there is a transistor needed in the oscillator stage that contributes some components in frequency determination.

This transistor has internal capacitances and resistances which also form part of the circuit that determines the oscillation frequency. Infact the internal capacitances are such that they have to be seriously considered at VHF frequencies and upwards, creating less of a problem at lower frequencies.

Also, the input impedance of the next stage after the oscillator also contributes a bit of capacitance into the frequency determining circuit.

Lets look at why there are changes in these internal capacitances, making the VCO drift. -

i) Temperature of the transistor.
Best thing you can do here seems to be wait a bit till thermal stability is reached.

But on the other hand there are two things one could do -

i.i) Use a modern Microwave transistor (still only around 2-3 $ a pop) that is useable into the GigaHertz. They have such small internal capacitances

anyway that when they change, the delta is so small as compared to the main C in the LC circuit, that you have very little freq drift created due to temperature stability.

Look at the circuit of the BF900 dual gate Microwave FET Oscillator made popular by Eric Van Gorkum. He still swears that it had the least drift he ever saw in a free runner, making the PLL a bit unncessary for pirate operation. (FRN hosts Eric's complete dia with commentary.)

The Pulz says that is the most stable Free runner he ever built. He has the circuit at his site as well.

Fantasy Radio Holland is using that circuit and say it is good enough to drive their 300W RF Amp.

(Links to all above sites are at my links page)

So question : Why are kit manufacturers not using such modern parts in their designs ?

i.ii) Use a frequency doubler or multiple frequency doubler stages. The idea is simple, use an oscillator that runs at 1/2 frequency to the main carrier frequency needed. It will need larger LC values to resonate at the lower frequency. By comparison, the internal capacitances of the transistor will now be much smaller, leading to much lesser effect of changes in the internal capacitances.

Double the Oscillator's frequency using a frequency doubler to get the original frequency you wanted.

Veronic@ needs to be commended for their 1w and 5W free running VCO designs. They seem to be the only ones trying to build semi-decent kits for this technology. The Frequency Doubler design gives it much more frequency stability than Smart Kit's equivalent 4Watter where the oscillator is running at the fundamental frequency.

So why are other kit manufacturers not using this well-understood technology ?

ii) Voltage and current across the oscillator transistor.
Here it is important to use a voltage regulator IC to feed the complete Oscillator stage, not just the Varactor.

Why do the Veronic@ and Sm@rtkit free running oscillator kits not have a Voltage regulator for the Oscillator ? It costs only a Pound !!

This is specially surprising in the Veronic@ 1W free runner, where there is a 78L05, but it is used to feed only the Varactor, when it could have easily been used to stabilise the Oscillator transistors as well.

iii) changes in Antenna load, changing the load impedance seen by the last stage, changing its input impedance (but thats the load impedance seen by the stage before it), changing the input impedance of the stage before it.... till there is a change in the load on the Oscillator.

Obviously then one should adjust the frequency of a free runner only after the correct permanent antenna has been connencted. If you change the antenna, the circuit will run at a different frequency with the new antenna.

But 1 or 2 buffer stages after the oscillator and before the power RF stages would isolate the Oscillator to a very large degree.

The Veronic@ 1W PLL and the 1W free runner use almost identical Oscillator stages with the frequency doubler. But why, oh why, do they not use the same buffer stages of the PLL on the Free runner ? It would have added a Pound to their cost of parts only, but made the freerunner kit drastically better.

In the last 4 months, there have been 4 new PLL kits released. When did you last hear of a new Free running VCO Exciter kit ?

So it looks like free running VCOs are being purposefully ignored. Is it because if the Free running started functionally equalling the PLL in frequency stability (Not stability down to digital precision, but functionally the same meaning less drift than that which makes receiver re-tuning mandatory) then less pirates / hobbyists would buy the more money making PLL kits ??????

If all kits/circuits available were higher technology / harder to comprehend / more costly, would tend to discourage rank beginners to get into the field and experiment, eventually contributing to fewer Electronic Engineers in the world. Even propogating the myth that circuits need to be very complex before they are functionally useable will have the same effect.

My Challenge to kit manufacturers : Redesign the Free running VCO kits you have to reflect modern parts and designs available now, while still remaining in the same price range.

Take this for what it's worth. I dissected an old Turner +3 to TS-520 mike plug and found the following:

Pin 1........Red mike lead
Pin 2......Black mike lead
Pin 3.......Bare (ground) mike lead

Hope this works for you. The white mike lead is not connected so I'm a little puzzled by that part of it.

Vintage Ham radio for sale....circa "1965"
"EICO 753" 80,40,20 meters...AM/SSB/CW
Vintage!!!
Pristeen condition, not a scratch, used by Non-smoker...
I don't know a lot about this unit, but it does fire up, receive's fine, and transmits....
Comes with matching power supply/speaker and an extendable Sure Desk Mic, & Manual.
Make offer...
Pat!

4719. FS - Larsen AD-2/70 Dual Band Antenna Coupler - New $28

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-18 00:00:00 UTC
From: dwills@northlink.com
Message-ID: <36027ad0.933715@news.northlink.com>
Source record: 131667
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment,rec.radio.swap

For Sale - Larsen Model AD-2/70 Dual Band Antenna Coupler. New in package - $28 shipping included. I have a few of these left.

This is a dual frequency duplexer that permits simultaneous operation in both VHF and UHF. This is designed for the 2 meter and 70 centimeter bands, but is useable on commercial VHF and UHF bands.

Crossband isolation is -50dB VHF @ 430 MHz and -60dB UHF@140 MHz. Power input is 200 watts max. Size 1.77" H x 2.63" W x 3" L

This will allow two separate antennas on a dual band radio or one dualband antenna on two separate radios.

[well thought out and written information snipped]

> My Challenge to kit manufacturers : Redesign the Free running VCO kits you
> have to reflect modern parts and designs available now, while still remaining
> in the same price range.

Well, for many decades, the designers of tube receivers used oscillators
that were stable because they had to be. There were only two tubes in
the FM tuner, and the tuner had to work in an environment that changed
greatly in temperature because of the tubes themselves. So designers
used components that had temperature coefficients that compensated for
the temp change. And you can tell a good tube FM tuner. Not only does
the dial have that feel, but once you set it to a station, it STAYS
THERE. It doesn't drift.

Today's design attitude is to throw technology at the problem. People
would rather use a PLL and microcontroller than a few special parts like
negative tempco capacitors.
This also makes the design hard to steal because the uC has a program
that can be protected from being read.

I don't think many builders are going to want to spend the time
programming a uC and getting it debugged to control the PLL properly.
They want to get on the air. So the VFO will be around as long as there

are people who roll their own FM TXes.

And good VFO designs made with the proper components will always have
their place in FM TXes.

Thanks for the info.

> HT with a repeater?
>

In most parts of the country, there are more 2m repeaters than 440 so as a general reply, 2m would be better for repeater use. If there is a goo system of 440 repeaters in your area, its a toss-up

Either would be fine for simplex.

There are many dual band radios on the market today that are just a little more expensive than a mono band HT. Generally, the low price dual bands operate on one band or the other at a time. But, it gives you the best of both worlds.

The low price dual banders are in the $300-350 range, vs $250 to $275 range for a monobander. A full, all-the-bells-and-whistles dualbander runs around $500.

That's the direction I would go.

You don't tell us anything about where you are.

Lee Valley, a company that sells woodworking tools and supplies, sells several different diameters of disc-shaped rare-earth magnets. They also sell metal "cups" to mount the magnets in to increase their holding power. (The cup brings the magentic pole present on the rear face of the disc magnet around to the front side).

Lee Valley has stores in several Canadian cities, and sells by mail order in Canada and the USA.

That's an interesting idea. And somebody could probably make some money
doing that. Reminds me of what I've read of the Yukon Goldrush; the
people who made the money weren't the people digging for gold, but
the people who sold the food and other goods, and ran the saloons, etc.

Does the one-way repeater mode have a one-second "hang time"? That is,
the transmitter keeps transmitting silence for 1 second after the
receiver squelch closes. The FT-51 does this in its one-way repeat
mode.

This might be handy if you were really using the radio as an actual
repeater for a bunch of people. But when you are using it as a
"booster" to access a distant repeater with a small radio, the
hang time means that whoever you are talking to has to wait a second
after you've stopped talking before they can start.

What the world needs is a one-way crossband repeater with no hang time.
I'm wondering if the FT-8100 does this.

I prefer either the 3-400z/3-500z or 811A series tubes.
The only reason is bacause the are inexpensive and
very available from many sources to purchase
when they need replacing.

Hi Dick,

The times I can think of that would be good to have seperate rigs would be if you are on HF searching for that DX and have your 2m on a DX packet cluster or DX Net. Possibly in an emergency situation where the locals are on V-UHF and state is on 80m. Just my opinions, I'm sure somebody will have some more ideas.

Good Day,
Chris

Regarding question number one, I purchased one about six months ago at Ham Radio Outlet in San Diego for about $175. It was the display model and I got a discount because of that but I was thinking that the regular price there was only about $210. This price included the AC adaptor, the carrying case, and the clip on antenna.

BTW, I am quite satisfied with it. I am a Ham and only do occasional SW listening. It seems quite sensitive, even with the built in whip antenna. Not terribly selective or with a lot of dynamic range but more than adequate for the price.

Tom

well, i have been a ham for 29 years and i have own a lot of radios..if you get one with all the bands in it..hf,6,2 and 440..if something would happen to the radio you would be out of service..it is nice to have it all in one box as far as moble operation but the same goes there ...i would say that having more than one radio is much better to operate..you can be on 2...440..hf...6 meters all at the same time and catch all those rare dx stations out the...
i run a 821h for 2 and 440..which i can watch both bands at the sametime..hf is a 930sat that does it all..and a ts-60 on s meters...and i run packet on another 2 meter radio...it sounds like it is alot of money out of there but if you shop around you can do a lot with a few dollars...

4739. Re: FT50/MAHA Multi Charger

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-18 00:00:00 UTC
From: Mike <michael.e.freeland@roundfile.boeing.com>
Message-ID: <01bde33c$33a47240$28bf7390@e682359.ca.boeing.com>
Source record: 131687

I too was skeptical, but I saw a couple of favorable posts and bought the Maha MH-C777a Universal Conditioner/Charger the other week. I couldn't believe how well it worked on the first battery I tried it with that on the next three batteries I tried, I actually tracked the times for the Discharge and Charge cycles. (I'm an engineer at Boeing...very detail oriented:)
I am still stunned by the results. Let me summarize.
Battery 1: I Ni-Cad battery to power an auxiliary light (halogen) for my cam-corder. New, it would last about 20 minutes. I'd didn't use it much, and within a couple of years, I only got 5 minutes out of it. I placed it on the charger. It was so dead, the charger didn't recognize the voltage. Let it charge for a few minutes, then cycled through Discharge and Charge cycles. It took less than a minute to do that the first 2 or three times. Like I said, a comatose battery, but I felt I noticed a trend that each time, the cycle took a little longer, so I persisted. Sure enough, after about 8 cycles (the last couple of cycles took a "long", more reasonable, time), I plugged the battery in, turned the light on and waited for it to die...and waited...and waited. The last time I checked the clock before I fell asleep, the light was still strong after 20 minutes. I was stunned.
Batteries 2, 3, and 4. A friend's cell phone batteries he said were no longer reliable. He was getting 2 hours of standby, tops. These batteries were then labeled and I tracked the times for EVERY discharge + charge cycle. The first few were FAST (< 2 min), then 5 - 7 minutes, then 15 - 20 minutes, then 2 hours. At that point, I took ONE of the batteries and put it on my cell phone and turned it on. Strictly standby, no calls. After 12 hours, the power meter was still at 4 of 6 bars, and once again, I fell asleep. SOMETIME in the night, the battery ran out of power.
Not to make this sound like a cure-all for rechargeable batteries, I'll tell you about one more. My friend asked me to try a 12V cordless drill battery about 7 years old. I put this one though repeated discharge + charge cycles, all taking less than 5 minutes with no improvement over time. In short, the battery is ready for the recycle bin.

Am I happy? I'm ecstatic. Do I own stock in MAHA or have any other interest? No, I'm just a happy customer. The pin locations are fairly easy to adjust, and the alligator clip accessory is a must. It adds a lot of versatility. The only thing I don't like about the charger is the whimpy cord between the unit and the temperature sensor. I'm wondering how long it will last before it gets tugged too hard and breaks. If it does and I can't repair it, I'll buy a new one, I that happy.

There are certainly reasons to have a separate radio for VHF-UHF (Packet, talking to a buddy on the repeater while operating HF, etc) but it sounds as though you already have a VHF/UHF FM rig. Even if you want separate boxes the all-in-one rig will give you additional modes for vhf/uhf that you wouldn't have anyway, thus a future purchase of, say a vhf rig for packet would not really be a duplication.

Alot depends on your budget, too. If you have just enough for, say an Icom 746, you wont do much better pricewise buying a new dedicated HF rig... so why not have it all?
If you have a fat wallet, I'd still go that way, and add another rig in the future, HF, VHF/UHF, etc.

Most importantly, get on the air with CW ASAP. It is the best and most productive way to increase your speed. And when buying that rig... if you plan to operate CW, the MOST IMPORTANT ACCESSORY to purchase is a 500 hz filter. CW will not be fun without it!

Good luck

Fred, K8PP

Hello,
I have a Toshiba clone laptop 486 dx4 100, with 200 meg HD and 8 meg
ram. Active Matrix monitor. Loaded with dos 6.2 and Windows 3.1.
I also have a Kenwood tm2570a, 70 watt 2m mobile, with pl tone
board.
I also have an ADI 201 ht with charger and handmic.

I am offering all of this for trade for a digital HF station in good shape.
Prefer all solid state rig.
Something along the lines of a Kenwood ts 430s with P/S and Antenna tuner.
Or even an Icom 740 or 745 with P/S and Antenna tunner.

You can e-mail me at:

Interesting!! Noone has mentioned landline over load during a disaster. All the available cells an bandwidth wont help in this situation. In California everytime the land quivers, my PacBell landline gets overloaded.

Regards,

Tony

Hi:
Is there anyone out there that has some sort of
programming software for this radio.

I know that the radio is EPROM controlled and you
need the dedicated programmer from the manufacturers
but, if you remove the EPROM only instead of the
whole board I imagine that it can be programmed
with some software especially written.

Any comments or suggestions are apreciated

All the above is quite correct, with one exception. Propagation at 2m is
more reliable and covers further distance. This is basically because there
is less obsorbtion of the signal from trees, atmosphere, etc. This of course
assumes both setups (2m,440) are equal in power, ant, etc.

More to the point, if you don't mount the kit in a decent metal
case it will drift a lot when the PCB is moved around.

Plus you need a frequency counter to set the frequency in the first
place, and most beginners haven't got one.

I'm not at all anti-VFO, but, let's face it, technology has come
a long way, and got a lot cheaper, in the last 15 years.
In this day and age, it really does make a lot more sense to
use the PLL.

Martin.

My 242 was set up as a base unit several months ago & has not been turned off during that time. My display is now almost totally useless due to the backlite in the display going dark, Has any one found this before & are replacement bulbs available ? RS said they were not from them but I could return it to customer service for repair at a charge. My Yeasu FT-7200 set up at the same time is fine.
ANY CLUES ?

==========
Rudy--
I am using a QRO Technologies Hf-2500DX with a pair of Svetlana
tetrodes, 4CX800a, also known in Europe as GU74s. These tubes are
Soviet/Russian milspec with equivalent capacity as the 3cx800a and
replacements are available for $180 each.

A disadvantage of amps using the 3-500s is that they need more drive
power than the ceramics. In many cases, a 100 w. pep exciter cannot
drive the amp to full output.

I have a friend who is a Engineer for the phone co. He tells me that while the chances of making a local during an emergency event is not good, in most cases you can make calls out of the area (long distance) with regularity. That is assuming that the line to the phone co. is ok mechanically. He tells me it's because of the way the switching facilities are designed. No circuits left to inter tie, but plenty to the LD network.

The Cantenna was shipped without oil and the builder put in their own oil.
Although it is true that a lot of the oil at that time contained PCBs, there is

no "original" oil - we don't know what is in Chris' "Can."
A lot of hams that weren't running high power used pure mineral oil.

That may be because the RF is getting back into the osc.

> Plus you need a frequency counter to set the frequency in the first
> place, and most beginners haven't got one.

It's pointless to use a counter to set the freq on something that isn't
going to stay there for more than a few minutes. It's just as easy to
set the freq to correspond with the dial on a FM tuner.

4764. Yaesu FT-415 HT - No Power up, HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-18 00:00:00 UTC
From: "David A. Heupel" <dheupel@talstar.com>
Message-ID: <6tuv3n$8nj$1@server.cntfl.com>
Source record: 131712

If anyone has experience with the Yaesu FT-415 2m HT, I have some questions. Mine isn't powering up at all. Battery shows wear, and doesn't appear to hold a charge, not even a trace charge. When NC-28B wall charger is plugged into battery pack, battery pack does not warm up at all. Past experience leads me to believe that battery pack is probably no good due to memory effects. Additionally, radio will not turn on when wall charger is plugged to battery, and battery pack is attached to radio. My questions are:

1) Can this radio function via the wall charger plugged in to battery pack when battery is attached to radio?
2) Is there a AC/DC converter that can be purchased that will fit the external DC coupling near the BNC antenna hookup? If so, what is the maximum current that can be used without destroying the radio? I already know that voltage maxes out at 16V. I checked Radio Shack, and none of their AC/DC adapters seem to fit the coupling.
3) Are there any known problems with these radios just going belly-up? I looked inside and the circuitry looks fine. There is no evidence of any damage.
4) Any other useful information you might pass along to me.

Thanks a million!

73,
David

KE>I don't know much about Micors, and I am having some trouble.
KE>I have a VHF one with the following #'s
KE>RADIO MODEL T73RTN3400A
KE>P.A. TLD3303A6
KE>EXCITER TLD3262B10

KE>I need to transmit 145.370 for our repeater.
KE>It was originally tuned for 152.XXXX
KE>I could get 100 watts out at that frequency, 60 watts at 147.240, and
KE>really nothing at 145.370.

KE>Am I using the wrong PA? The exciter seems to work properly. Anything I
KE>can do to make the PA go there?

I do not have manual available so cannot talk specific values, Best help is
getting a manual with schematic/parts listing. The unit is being used outside
the range that the existing circuitry will tune to. Modification to go lower
involves replacing or parraleling a number of existing fixed capaciters in
the string of tuned circuits to achieve operations at the lower frequency.
The values used by motorolo are spceched in the manuals and you can decide
from your own inspeciton wheither you will attempt to "gimmick" the existing
caps, or replace them. I have done several and they worked fine after the
mods, but it was a labourius process...g From my own experince on non-micor
units; probably the PA will tune to the lower freq, but the exciter is not
so forgiving and the drive to the PA is too low. An O-scope or rf-voltmeter
is a tremendos aid to tune up. Your results are consistant with my experince
when moving units into ham bands.
KE>Thanks in advance. Just trying to get the club's repeater back on the
KE>air!

4778. FS:M216's UHF + New Radius/Kenwood radios

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-19 00:00:00 UTC
From: Unit 61 <zjohznabzlez@execpc.com>
Message-ID: <6u16jd$pki@newsops.execpc.com>
Source record: 131526

I have 2 Radius M-216 UHF mobiles for sale. 16-pin, 25 watt.
Both are in mint condition and have never seen
rough service.

One was used as a base station since new and comes
with power cable, mic, mic clip, base mounting tray.
Model: D34LRA7PA5CK Ser: 778TTL0684

The other was used in a mobile application and comes
with mounting bracket, mic, mic clip, power cable.
Model: D34LRA7PA5CK Ser: 778VQW1819

$275.00 each or $525.00 for both plus shipping.

I also have a limited number of new & unused Motorola
Radius, (M1225, P1225, GM300, GP300, etc VHF & UHF) for
sale at almost dealer cost. These are USA models.
Not export/import. M1225 UHF would be $425.00 plus
shipping for example.

Kenwood TK-760, 860 mobiles and portable procucts also.

If interested in any of the above, email for details
and prices.

John (to reply remove all of the z's from address. spam control)

4779. Re: Timewave's new area code is not enabled everywhere!

My daughter called our fone company, US West, to get voice mail.
We live in area code 651, but was told that there was no 651 when she
was asked for her fone number. She explained to the sales person that
this will be our new area code in Jan 99.

We have been told to practice using it now, in order to get used
to it.
FYI- The twin cities got divided up. Minneapolis is 612 and St.
Paul is 651. We can still dial each others city with out area code
until Jan.

4781. FS: ICOM AT-180 TUNER $350

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-19 00:00:00 UTC
From: jhulet@aol.com
Message-ID: <19980919172321.06540.00001758@ng74.aol.com>
Source record: 131529

Hello,

I have an AT-180 tuner for sale. I purchased it for my new 706MKII but seems I'm always mobile. The tuner matches the 706 line and runs off the power of the radio. It tunes 6m thru 160 and is the same size as the 706. Tuner is in excellent condition and in box ready to ship. I would like to send it COD. I'm asking $350 I'll catch the shipping to you...

Thanks!

Hello,

I have a very nice Yaesu FT-50R hand-held for sale. It is in excellent condition. It comes with the following;

5 watt battery (battery life is great)
Protection case cover(CSC-68 = $17.00)
Speaker Mic (HM-34 = $31.00)
New improved belt clip with spring clip (a must)
Cig adapter (E-DC-5B = $27.00)
Wall plug charger
Manual and spec sheets
Box is Mint

Asking $300 for all, I'll ship COD.

Thanks!

Hello,

I have a hardly used Mirage B-310-G 2 meter amp for sale. It is 250mw to 8 watts in for up to 100 watts out. Its modes are FM, CW, and SSB. Works wonderful and has a fan to cool itself... I've upgraded and am just not using the amp as I am into HF now..

asking $150, I'll catch the shipping and will send COD.

Thanks!

KE>Subject: PLEASE HELP: VHF MICOR
KE>Date: Sat, 19 Sep 1998 05:43:23 -0500
KE>Message-ID: <MPG.106d46ace6ec59c698968a@news.gnofn.org>

KE>I don't know much about Micors, and I am having some trouble.
KE>I have a VHF one with the following #'s
KE>RADIO MODEL T73RTN3400A
KE>P.A. TLD3303A6
KE>EXCITER TLD3262B10

KE>I need to transmit 145.370 for our repeater.
KE>It was originally tuned for 152.XXXX
KE>I could get 100 watts out at that frequency, 60 watts at 147.240, and
KE>really nothing at 145.370.

KE>Am I using the wrong PA? The exciter seems to work properly. Anything I
KE>can do to make the PA go there?

I do not have manual available so cannot talk specific values, Best help is
getting a manual with schematic/parts listing. The unit is being used outside
the range that the existing circuitry will tune to. Modification to go lower
involves replacing or parraleling a number of existing fixed capaciters in
the string of tuned circuits to achieve operations at the lower frequency.
The values used by motorolo are spceched in the manuals and you can decide
from your own inspeciton wheither you will attempt to "gimmick" the existing
caps, or replace them. I have done several and they worked fine after the
mods, but it was a labourius process...g From my own experince on non-micor
units; probably the PA will tune to the lower freq, but the exciter is not
so forgiving and the drive to the PA is too low. An O-scope or rf-voltmeter
is a tremendos aid to tune up. Your results are consistant with my experince
when moving units into ham bands.
KE>Thanks in advance. Just trying to get the club's repeater back on the
KE>air!

> bunch of wire, and hope for a good signal.

I have one,... Tho not bad for the money, It still has a few bugs the
company hasn't fixed.
But the tuner is great!

I'd spend a few dollars more and get a rig like the Kenwd ts-50 , then add
the tuner.

Hello *,

just stumbled across the TenTec Scout WWW-page.

Could someone drop his opinions on this rig?

I would like to start with HF (done VHF/UHF only until now) and I want to
build a portable rig.
Can anyone recommend a lightweight tuner for "thrown-over-a-tree" or
"kite-lifted" type of long wire antennas?

Tnx, 73,
Detlef, DH3DM.

I have a Varian 5 to 6 kw 10ghz CW Klystron for sale. I can no
longer
afford to purchase supplies for building a power supply. It was tuned
at
the factory at six discrete passbands at the below center frequencies.
Included will also be the 22 page Acceptance Test Data Sheets,
operating instructions and test results. (Freq. response vs bandwidth
for
each band)

Band 1 10301.7 Mhz
Band 2 10343.3 Mhz
Band 3 10385.0 Mhz
Band 4 10422.5 Mhz
Band 5 10326.7 Mhz
Band 6 10410.0 Mhz

Bandwidth 25 MHz

It is worth over $8,000 new, but this is somewhat used. and I will
sell for
$1,850.... (or best reasonable offer plus shipping from Honolulu to
your
address) I would like to get it off my workbench and out somewhere
where
it can be put to better use. I have a 2 meter dish, but this unit
needs a
bigger and better antenna.
I will include the 2 focusing magnets, (large and heavy). Buyer
pays shipping. Estimated weight is about 250 lbs for both magnets (2
ea)
and tube. Don't be shy in making an offer.

Anyone for EME? (moon bounce) or is it possible to bounce off Mars?

I will scan a data sheet, a small picture and E-mail it to anyone who
is
seriously interested.

Regards
Ray

Band 1 10301.7 Mhz
Band 2 10343.3 Mhz
Band 3 10385.0 Mhz
Band 4 10422.5 Mhz
Band 5 10326.7 Mhz
Band 6 10410.0 Mhz

Bandwidth 25 MHz

It is worth over $8,000 new, but this is somewhat used. and I will
sell for
$1,850.... (or best reasonable offer plus shipping from Honolulu to
your
address) I would like to get it off my workbench and out somewhere
where
it can be put to better use. I have a 2 meter dish, but this unit
needs a
bigger and better antenna.
I will include the 2 focusing magnets, (large and heavy). Buyer
pays shipping. Estimated weight is about 250 lbs for both magnets (2
ea)
and tube. Don't be shy in making an offer.

Anyone for EME? (moon bounce) or is it possible to bounce off Mars?

I will scan a data sheet, a small picture and E-mail it to anyone who
is
seriously interested.

Regards
Ray

I cannot find another charger that is as good for less than $500.00. It differentiates between NiMH and NiCd packs - and conditons/charges them accordingly and properly. The arch nemesis of NiMH packs, HEAT, is constantly monitored with the temperature sensor.

It is a great deal for fifty bucks.

4808. BASIC code for CI-V interfaces

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-19 00:00:00 UTC
From: roncook@worldnet.att.net
Message-ID: <3602f455.1666562@netnews.worldnet.att.net>
Source record: 131571

Hi! A few days ago I happened upon some code in GW-BASIC and
QuickBASIC for communicating with Icom rigs through the CI-V
interface. Unfortunately, this was found initially through a search
engine; which engine I no lnger recall.
After using about 15 hours of online time to re-search and not
locating it, I thought I'd ask :)

I found some VisualBASIC code snippets I can use as a guide but it was
not the code I saw earlier.

And, yes, I checked to see if I had, in fact, downloaded the code :)

If anyone has run across this stuff would you be kind enough to post
the URL here ?

Thanks!

Won't really need the 500 Hz filter if you buy the Icom 746... the DSP works great for CW work..!

Fred Doob wrote:

4819. Timewave's new area code is not enabled everywhere!

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-19 00:00:00 UTC
From: rgawtry@timewave.com
Message-ID: <36033f73.0@news2.minn.net>
Source record: 131582
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

The response to Timewave's new PK-232/DSP upgrade kit for the PK-232 has been outstanding, but some people have had difficulty reaching Timewave by telephone because of the new area code (651) assigned to the St. Paul, MN area. Some telephone switching centers (including some major telephone companies, cell phone companies, and some private companies with call restriction by number) are not programmed to accept the 651 area code. You may even be told the 651 area code doesn't exist! If you have this problem when you dial 651-222-4858 to get Timewave, just use the old St. Paul area code - 612-222-4858.

Upon some investigation of this problem, we found that it is a common problem around the country as new area codes have proliferated. One parent couldn't call his son at college for two months! If you have the problem, talk to your phone company service department or to your company telephone system administrator. Some companies are very uncooperative and others fix the problem within a few hours.

73,
Randy Gawtry, K0CBH

Brand New Portable Antenna Analyzers for sale.

Active VSWR meter giving direct readings of both VSWR and % reflected RF power.
It is designed to check the exact resonent freq. of any antenna, HF, VHF & UHF.
It has a 4 digit freq. counter and an analogue meter, with a switch for 2 freq.
ranges and 2 knobs for freq. adjustments, Fine & Coarse.
It has major advantages over a standard VSWR meter in that it sees the antenna
system exactly as the Transmitter sees it, plus the frequency is swept to see
where its resonating. Makes trimming so much quicker and easier !

First of all you should know that FT-847 cannot be put in two way cross
band repeat !
The thing works just one way.
The procedure is simple
1. Switch on SAT mode
2. On both VFO's set the TX and RX frequencies
3. Switch the X RPT to ON (it's int the menu, no. 41)
4. Enjoy...

Does anyone have an unwanted 12 volt DC module and power lead for the
FT901 transciever they are willing to sell - I want to go mobile !
I guess its the same module for the FT902.

Does anyone have a keyer module (for the same rig) for sale ?

Is there a spare FT902 out there ?

Ideally I'd buy an FT902 with a DC module and a keyer and sell my
FT901. If you have an FT902 for sale - please let me know.

73, an FT90* fan

Andrew

George, I have used a Heil cartidge in the SM-6, SM-8, SM-10 and SM-20 and they work great. The screw off heads won't fit back on because of the cartridge size so I have always used a foam style mic cover(you can buy them at a music store or Radio shack). Mic cartridges can be positioned in proper direction with double stick tape and don't forget the inline cap to the audio lead (I use a 1 mfd or .47 tandelum) minus side toward cartridge and plus side toward rig. If you don't you will load down the cartridge, remember voltage is on the audio lead (reason for cap). Microphone then sounds much clearer than stock mic. without the usual low order distortion.

Source record: 131595

This was Originally a TNT amp it has 8x2sc2290's (same as
Texas Star DX-1200). I have bypassed the driver (mrf455) installed a
tuned pi input circuit and added another relay to bias the amp AB1. A
stock 2950 will drive it to 400+ on SSB, drive it with a ham rig and
100 watts input gives 800 watts out on SSB. All figures stated are
into a dummy load with a DAIWA meter at 14V. I GET EXCELLENT AUDIO
REPORTS ON THIS AMP!!!!!

This was Originally a TNT amp it has 8x2sc2290's (same as
Texas Star DX-1200). I have bypassed the driver (mrf455) installed a
tuned pi input circuit and added another relay to bias the amp AB1. A
stock 2950 will drive it to 400+ on SSB, drive it with a ham rig and
100 watts input gives 800 watts out on SSB. All figures stated are
into a dummy load with a DAIWA meter at 14V. I GET EXCELLENT AUDIO
REPORTS ON THIS AMP!!!!!

Reason for selling, going up to a 8x2sc2879 amp.

It is about 3 months old works 10-15 meters. $450 obo

4834. PLEASE HELP: VHF MICOR

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-19 00:00:00 UTC
From: kevin@websolid.net
Message-ID: <MPG.106d46ace6ec59c698968a@news.gnofn.org>
Source record: 131597
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I don't know much about Micors, and I am having some trouble.
I have a VHF one with the following #'s
RADIO MODEL T73RTN3400A
P.A. TLD3303A6
EXCITER TLD3262B10

I need to transmit 145.370 for our repeater.
It was originally tuned for 152.XXXX
I could get 100 watts out at that frequency, 60 watts at 147.240, and
really nothing at 145.370.

Am I using the wrong PA? The exciter seems to work properly. Anything I
can do to make the PA go there?

Thanks in advance. Just trying to get the club's repeater back on the
air!

Kevin

4837. IC-735 Whistle in audio - What to do?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-19 00:00:00 UTC
From: David Green <green@c031.aone.net.au>
Message-ID: <360398A0.EDFA4026@c031.aone.net.au>
Source record: 131600

My old IC-735 has always had a whistle in the audio which is pretty high pitched and not too loud so I haven't worried too much about it. It's one of the early ones (from 1986) and now I'd like to fix it!

Can anybody give me clues as to what to have a look at. The pitch of the audio changes as the PBT is adjusted. Higher pitch on USB than LSB (which is same as CW) and around 4-5KHz. Something isn't balanced but I don't have sufficient data on the radio to dive in.

thanks ... David (VK3DGN)

No, we generally are not.

>>the odds are about 100:1 against an amateur being the first communicator
>>on scene.
>
>for an area wide emergency we cant help be on the scene since we live
>in the affected area

In any emergency, wide area or not, emergency response is still a point process. The person trapped in a collapsed building is still at a specific location. If we don't happen to be there also, we can't provide on the scene communications. The person trapped on his rooftop due to a flood is still at a specific location. If we don't happen to be there also, we can't provide on the scene communications. Etc. It is not different from being on the scene of an auto accident. Either we are in position for emergency response at the point where emergency communications is required, or we aren't.

We're very thin on the ground, so we aren't often on the scene where we are needed compared to other more widely accessable radio services such as cellular or even CB. In the latter context, it is noteworthy that military contingency planning for large scale disaster response considers CB to be the only independent civilian radio communications service widely deployed enough to be suitable for consideration in their martial law plans.

Amateurs are too thin on the ground (and mostly the operators are too old and too unfit to serve), and as several of you have noted, cellular in your area may not be robust enough, though oddly enough, the military is in the process of deploying battlefield cellular systems as I type. Cellular technology has grown to be much more robust than it was only a few years ago. The key changes have

been the ability to prioritize ESNs to deal with cell congestion, and at least for battlefield systems, the adoption of CDMA which resists jamming and makes DFing difficult for those outside the system (though CDMA location is easy for the system itself since ranging is inherent to the CDMA sites, and to TDMA systems too for that matter).

>I was just wondering if this new satillite technology is hardened again
>solar storms. Since we are coming up on the next solar cycle, things should
>get interesting...

They're doing all that they can to harden them, and that's quite a lot really. Most of the satellites designed for mobile phone service are LEO, so they are protected from most solar activity by the Earth's magnetosphere. The GEO sats are more vulnerable, but they are generally hardened much more extensively too because they are much more expensive, and there is less redundancy in their constellations to pick up the traffic if one should fail.

It probably should also be noted that while solar activity in general is picking up, the most intense flares occur when we are *not* at the peak of the solar cycle, and flares present the greatest threat from the Sun to satellites. Probably the biggest threat to large LEO constellations is collisions with space junk. Those orbits have the greatest collection of that stuff, and the amount of it increases with every launch. Of course space is large and satellites are small, so the actual chance of collision is far less likely than it may seem.

IMHO, separate rigs would be best if you have the money and the room. A friend of mine bought one of the yaesu HF rigs that uses the vhf modules, he was disappointed that he couldn't monitor one band and use the other. Wound up buying a separate vhf unit.....

Can't say I didn't tell him so :o)

>simultaneously on HF and VHF?

There are many times when one wants to *listen* on more than one band at
once (though a scanner can fulfill that role in many cases). And there are some
times when you may want the ability to be able to operate on VHF and HF at the
same time. For example you may be working Lower Slobovia on HF and your
buddy calls you on VHF to confirm a lunch meeting. You want to be able to
quickly answer him while continuing your HF contact. Of course for satellite
operation, the ability to operate *full duplex* is very important so that you can
monitor your own downlink. Most of the HF/ VHF/UHF rigs can't do that, even
those touted for satellite use. Another use is for digital gateway operations
where you may want to be able to maintain links on HF/VHF/UHF simultaneously.

The all in one boxes are cheaper and more convenient than separate rigs,
but there are times when the flexibility of multiple rigs is useful, and the
inherent redundancy of having more than one rig means you aren't totally
dead in the water if one radio fails. I've gone both ways, and wound up with
multiple rigs, one of which *is* an all in one. There's no such thing as having
too many radios. :-)

"Packed"??? full of features?? The HTX-202 must have the least amount of features of any 2M radio currently sold today. Every 2M radio sold by every Mfgr has more than just 2M recieve ability, And with it's 12 to 16 memories it has about 2 to 100 times less memories than all the others, most other models have Illuminated keys, the HTX -202 is the largest & heavest 2M handheld currently produced, If it's not on sale it's one of the more expensive 2M ht's, if it is on sale it sells for what all the others do, and I could go on..... I don't actually dislike the radio & used to own one, but i'm tired of all the one sided stuff i read about the HTX-202. Let's face it, If the HTX-202 originaly came out as a " cobra" or "Maxon" (actual mfgr) or "emerson" brand 2M ht, it would have been laughed off the market years ago. Just a little perspective.....

Not the HTX-202, and that's its most important feature. That's what makes it the most robust amateur HT against overload and IMD currently sold. That feature alone makes the radio a best buy.

The laptops ARE to be used for a law enforcement project. Is it true that you LIED to the Maricopa County Sheriff's Office, telling them that Roland said he was a Deputy Sheriff when in fact he would never say that? If you did lie, and you are in fact a police officer, then maybe someone needs to take some action with the Internal Affairs office at YOUR agency. There's nothing worse than a corrupt cop.

Source record: 131370

For Sale: Standard C528A H.T. with CSA 160 rapid charger, two nicad packs one
of which I just rebuilt with new nicads, also with brand new Larson mag mount antenna
for 2m and 440mhz. MM2/70 PL($40new) I do not have the rubber duck antenna
for the radio. I have instructions. This radio runs true twin band operation
not just a dual band HT. It is in great condition not abused and works fine,
I don't need the radio now. The rx will also cover out of band 300-400Mhz ,
800-900Mhz and and is an outstanding HT. Asking $239 plus $10 shipping.
Thanks for reading. Al N7FGV

Source record: 131373

I am looking for three Kantronic KPC-3's (any version firmware will update) and an older KAM Plus (will update firmware) for APRS in western Montana. Sites would be Bozeman, Great Falls and Missoula (will link to Kalispell) for the KPC-3's to link into Helena, Montana. The Kam Plus would be here at my qth for receiving APRS packest on VHF and HF for gateway to the internet. I don't have a lot to spend soooo if you have any of these TNC's please let me know and what we can work out.

Bill KA7YAO Helena, Montana

It doesn't have a heater switch because it has no provision for running
mobile like the 520 & S did.. Different power transformer, several other
differences too...

When you open it up to check the memory backup battery, look for any signs of electrolyte leakage that might have dripped on the PC board. I had this problem years ago with my 3000, and the symptoms were the same as you mentioned. After replacing the battery, I cleaned the crud off the board with some isopropyl alcohol, reset the microprocessor, and it cured the problem.

To maintain the exact color as the VFO filter you could use some of the original blue filter material for the meter as well. Drake sells it on line at:
http://www.rldrake.com/tech/parts/partshtml/partslist.html

Do a search on the word "blue".

bcrotty@my-dejanews.com writes:
>1. Does anyone have any feedback on the advantages/disadvantages of the
>Kenwood TH-G71?

advantages: water resistant, probably rugged, lighted keypad, relatively low
cost

disadvantages: not a dual-receiver dual-band - won't monitor two frequencies
simultaneously, won't do full-duplex, won't act as repeater
(none of these functions may be important to you)

>2. What other handhelds should I consider, and why would they be better than
>the TH-G71?

Look at the Yaesu FT-50 as well. It's probably the closest to the Kenwood
among other handhelds, with many of the same advantages and disadvantages.
(Though FT-50s seem easier to find used, having been around longer).

>3. Any feedback on the Kenwood TM-G707A versus the Icom IC-706 MKII?

Those are *very* different radios. Do you want VHF/UHF, or HF plus a bit?

>4. What other mobiles should I consider other than these two, and why?

The Icom IC-207H is much like the G707 - dual band, but single receive.
So look at it as well as the G707.

There is also another class of dual-band dual-receiver radios: Kenwood
TM-V7, Icom IC-2710, Yaesu FT-8100/8500. These will monitor two
frequencies, and do crossband repeat. The latter is more useful in
a mobile than a handheld - it allows you to have your car act as
a high-power repeater for the low-power signal from your handheld.

But they're all more expensive.

I can't say much about HF mobiles like the IC-706.

Dave

> I am looking for an inexpensive way to get a bunch of these for
> experimentation,

Dave,

There are inexpensive magnets and there are RARE earth magnets. There are not any inexpensive rare earth magnets that I've ever seen. I purchase over 2 million $ worth of "Rare Earth" magnets a year and would be willing to sell you some at my cost. That is going to be as inexpensive as you'll ever get. We buy the raw material, cut (and shape it), and magnetize it here, so we can save you $ by selling you a "standard" product (i.e., one that we are building in quantity). Being that the material is very fragile and breaks easily we always have some with (very minor/cosmetic) defects that we would also sell for less money. E-Mail me your phone # (if you're interested) and I'll call you to see what you're interested in and then quote you an appropriate material, size, strength and (this is of course judgemental) price.

I'm an insatiable experimenter in magnetics. We have done all kinds of really wild stuff with magnets, including making them into "springs" for a telegraph key, which also activated magnetic reeds for the contacts. We sell a line of magnetic jewelery and make magnetic pain killers which are sold in many major national magazines, virtually all golf shops, and Nationally on Prime Time TeleVision. We have parts in most man made satellites, aircraft, artillary shells, automobiles, & etc. & etc..

> use the PLL.
>
> Martin.
>

Yes, 100 pound for a PLL is actually a pretty nice deal now as compared to prices of yesteryear.

But the point I am trying to make is that if you had a good free running VFO kit available at approx 30 pounds, and suppose that doubled the number of hobbyists dabbling with electronics, It definitely is worth it.

What pains me is that it is very possible to have quite a decent VFO within that price range, but kit manufacturers seem to be ignoring the low price range kits, in favour of money making kits.

I am definitely not saying "Down with PLL", only saying - "Use appropriate technology". The small time hobbyists and small pirate should have access to a good VFO kit to begin with. Veronic@ comes close, but with 2-3pounds more of buffer and low capacitance transistors, they can be superlative.

So what i would love to see is this :

A 30 pound VFO kit that has voltage regulator, low capacitance transistor based oscillator, frequency doubler, 2 buffer stages, 1-2W output, negligible

drift.

Thats the challenge.

4883. ICOM 706 - Maximum length for control head cable ??

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-20 00:00:00 UTC
From: Gordon VE3JSJ <gem1@ibm.net>
Message-ID: <3604F939.143A@ibm.net>
Source record: 131472

I have used the ICOM 706 (original version) as a mobile rig for a couple of years, the control head attached to a 'stalk' convenient for me as drier, and the rig itself stashed under the passenger seat.

Can any tell me what the maximum length for the control lead can be? I would like to operate the rig from my trailer - probably 30 feet from the rig - and just move the control head, not the whole set up.

Any ideas? Where can I get those connectors to make my own cable?

Gordon VE3JSJ

4888. Re: ICOM 706 - Maximum length for control head cable ??

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-20 00:00:00 UTC
From: Fred Doob <fdoob@solder-it.com>
Message-ID: <36050A91.1D2CBC52@solder-it.com>
Source record: 131477

Why not call Icom and ask, or e-mail them. Instead of buying the
connectors, you could pick up a standard separation cable, cut it in the
middle, and add length tehre so connectors would be intact.

Howdy Kevin....Don't have a Micor manual in front of me but from what I recollect, you're outside of the operating band for that particular Micor at 145 Mhz. Check out this URL for more info...conversion is quite a chore sometimes so you might be better off to swap for a Micor in the next lower band. http://www.kuggie.com/rbtip/

Sounds like you hit the nail on the head....Your sidetone is being picked up by the mic still connected and retransmitted (I'd think that the mic should be out of the cct on CW but have seen this with other rigs over the years!). Likely its because they're using the VOX for QSK and are doing it on the cheap. You might try disconnecting the mic and keeping the audio up as you'd like it to see if problem still persists. IF IT DOES then I'd suspect microphonic action within the case...might try an external speaker (if you use an internal speaker now) to see if THAT cures the prob. Best of luck to ya.

Look at the PA schematic and parts list. Note the capacitor values for the tuned circuits. Either replace, or pad the existing capacitors to the values indicated for the split that covers the 2M range If you don't need 100 watts, the 45 watt unit is a lot easier to pad down (less tuned circuits in the PA) and to keep operational.

Source record: 131493

Just purchased an NRD545 and am generally pleased with it. Two niggles
tho, one of which isn't fixable other than by JRC I guess.

1) The bandwidth in AMS mode is far too wide and can't be narrowed - or
does anyone know otherwise?
2) Page 9 of the poorly written handbook talks about 5 different preset AGC
decay times but pressing the AGC button on mine only toggles between OFF
and 1. Anyone know what I'm doing wrong or has it been locked by JRC?

From: daveem@webtv.net (daveem m) Date: Tue, Sep 15, 1998, 10:51am
To: daveem@webtv.net Subject: 6.500 relays for sale
I have approximately 6.500 relays for sale to the highest bidder. I will also sell them in much smaller portions if needed. The manufacturer is Potter & Brumfield.
The part # is T90S1D12-12 The ratings are as follows, The case on the relay says,
30A,240VAC
10A,240VAC
15A,125VAC
They are normally open untill they are turned on. Single switch contact. Coil is designed for12 volts.It has 153 ohms resistance across it. I have been able to turn these on with as little as .050 M.A. but at 12 volts they will use .078 M.A.
They are printed circuit board type mounts. There size is as follows
Length, one and a quarter inches
Width, one and an eighth
height three quarters of an inch.
they are not a perfect rectanglular shape but close. I can be reached at 541 479 -3915 if I am not in leave a message. Dave Maltz

>I want to
>build a portable rig.

The TenTech Scout is very unstable at anything like <12vdc. As such, it is not a good choice for portable operation where you will be using battery power.

As for tuners, most will work with a random wire. You might look for a Yaesu FC-70M. This tuner is for random wire only, and was part on the Yaesu "Man-Pack" set.

> to spend the money to buy a remote head mount
I have the remote head hardware and had the same problem. I tried the
eraser trick on the contacts but with out much luck. Later tried a good
contact cleaner on the contact points - both sides - and the problem has
nicely gone away! The only other problem with the 733 that I have had
was the foam pad in the microphone switch getting soft in the heat. The
radio would transmit for a couple of minutes the first time, then for a
few seconds, and then for a fraction of a second when depressed. Tracked
it down to the microphone. It was fixed by cementing a small washer
between the button and the foam pad to add an extra .020" or so to the
stack.

He didn't even need the tracking number. Federal Express in Phoenix
Arizona contacted Mr. Geter personally to pick up his package. They had
the package waiting for him and he never picked it up! They (Federal
Express) and I contacted him several times to pick up the package but he
never picked it up!

> The laptops ARE to be used for a law enforcement project. Is it true >that you LIED to
the Maricopa County Sheriff's Office, telling them >that Roland said he was a Deputy
Sheriff when in fact he would never >say that?

WRONG! He told me what the laptops were to be used for and that he was a
deputy sheriff for the Maricopa County Sheriff's Office. If he didn't
tell me that, how would I have known that fact, crystal ball???
I also have several e-mails from other amateur radio operators he has
done the exact same thing to, I guess we are all lying and Roland Geter
is the only one telling the truth!

>If you did lie, and you are in fact a police officer, then maybe >someone needs to take
some action with the Internal Affairs office at >YOUR agency. There's nothing worse than a

corrupt cop.

No, I did not lie and I substantiated my facts with the Maricopa County Sheriff's Office with documentation. I will be more then happy to submit to a P.S.E. test, (more accurate then a regular polygraph), given to me by any qualified and certified law enforcement agency/operator
> - Harold

Harold, get your facts straight before you accuse someone of something you have no personal involvement in and are only getting part of the story. The Maricopa County Sheriff's Department was satisfied with the documentation I provided them, something you apparently weren't informed of.

Source record: 131510
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.boatanchor,rec.radio.swap,

I recently listed a BC348R, on an AS IS basis. A number of folks have responded asking if I would sell parts off it. If you need BC348 parts, please let me know, and if there is enough reason, I will break up the set and sell the parts. There is no dynamotor in it, and the cabinet has had some holes drilled to vent air, and install a couple of pots, so cabinet itself may not be reusable. There is lots of good stuff though, mechanical gearing, caps, knobs, dial glass, controls, tubes, chassis parts and the like.

4922. Re: Wanted Manual for Pro 43

You may find some *basic* material at Tandy's Web site:
< http://support.tandy.com >. The manual is likely still under
copyright by Tandy but any RadioShack store should be able to order it
for you.

You can also order it yourself by calling 1-800-THE-SHACk or
1-800-434-2024 (RadioShack Unlimited).

The reference numbers that I have for the user and service manuals
are:

User: 10845139

Service: 10823128

Bear in mind that these numbers may well have changed but they'll give
RSU a starting point if in fact they have changed.

Hope this helps.

David,

I consider the two bands pretty much similar in propagation. Because of the shorter wavelength, a 440 antenna of the same size will have slightly more gain (i.e. a half wave 2m antenna will be more than a full wave antenna on 440). However, I think the most important consideration is what others with whom you want to communicate are using.

>location. If we don't happen to be there also, we can't provide on the scene
>communications.

i think we're talking about 2 different things. emergency services,
whether in an area wide emergency or not, will always deal with those
things. in terms of info coming out of an affected area, or H&W
traffic, etc, the emergency services wont do that.

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.shortwave,rec.radio.amateur.equipment,

I have the following Hallicrafters for sale - shipping and packing extra.

S108 General coverage reciver, nice condition, and running well. $125.00

S85 General coverage receiver from the 50s, relive you novice days with this one. Nice clean set. $90.00

SX25 1940s General coverage set. Playing, no mods to cabinet, needs a bit of a cleanup, and should be recapped. Has good dials and S meter. The crystal knob is not original, but is a Halli knob from another model, and looks almost the same. $90.00

S38D Short wave set, looks about a 7, good working chassis, original knobs and nice dial. $45.00

CB8 Citizens band portable hand held transceivers I have a pair of them in their boxes, with leather carrying cases and battery chargers. Both are running and are a 9 or better cosemetically, although the origianl boxes look a little the worse for wear. $ 90.00 for the pair.

Hello,
I'm selling a ADI dual band handie talkie with 12 volt nicad, charger, leather case, and manual for $200.00 firm. I'll pick up shipping costs. This is a full featured dual band, capable of out of band tx/rx. Will also receive AM aero band transmissions. I've only had this a few months, am selling because I would like to upgrade into a different radio. The radio is extremely clean, seldom used outdoors.

You haven't read, I guess, the current issue of QST, which has a review of this rig.

A friend locally just got his, and the first one smoked. To their credit, SGC replaced it with a new one. The new one did not transmitt and receive on the same frequency. This one they repaired, but he still reports trouble.

New gear always seems to have some "field trials" needed. Unfortunately, Hams have to finance these trials! Nearly every rig, except the Alinco DX-77T, which has been reviewed in QST, has either had a failure, or failed to meet advertising claims, or failed to meet FCC requirements for spectrial purity.

IMO, it would be wise to wait. And for the money involved, I would look at the FT-840, used. $650 can buy alot of radio used, and some dealers offer used gear warranties, too.

4941. Icom 706 Mk2 CW Weirdness

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-20 00:00:00 UTC
From: Fred Doob <fdoob@solder-it.com>
Message-ID: <36048D83.5A85DCC5@solder-it.com>
Source record: 131566
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I recently installed a 706 in the car and was getting reports that my CW signal was being heard twice about 600 hz apart... sounded like it was in a jar... much like the beeps from WWV. Well, I checked EVERYTHING. SWR flat, great ground, torroids on all leads, direct dedicated power source, etc. etc.

I finally found what was doing it and am wondering if any other 706 users out there have the same probem... or maybe you have it and dont know... who ever gives a 597 report?

It seems that (I operate qsk) when the audio gain is turned up, somehow the sidetone is being transmitted. If I turn the audio down and transmit, the signal is clean. If anyone has had this problem, please let me know. Icom says they have had no reports of this. If you have the time and interest, please try it. Have a friend tune through your signal with and without your volume turned up.

If you have a clue as to why this is happening, I'd love to hear from you.

Thanks for reading this.

4946. need help on Cardwell capacitor part numbers

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-21 00:00:00 UTC
From: Peter Shintani <shintani@funtv.com>
Message-ID: <36073730.C3D0E91A@funtv.com>
Source record: 131321

Hi:
I have two Cardwell capacitors
1) 152-505-1
It is a split stator cap
2) 153-511-5 71313
it is also a split stator cap
Any info on these two caps is appreciated. I plan to use the cap with
the higher voltage rating for a magnetic loop antenna .

I for one share your opinion that effective emergency communicators need
to cultivate the ability to utilize any and all forms of communication
that will assist in disseminating information from any point to the
needed point.

Would you consider enlightening us on implementing the skills you have
listed below, or point to sites where the information is available?

Louis

From: bcrotty@my-dejanews.com
Message-ID: <6u4hunjas1@nnrp1.dejanews.com>
Source record: 131404

Hello group.

Just yesterday, I received my CSCE for Technician class. This is my first amateur radio license, and I am obviously just getting into the hobby.

I am interested in getting a good mobile unit for my car, and a good handheld unit, as well. My girlfriend will be getting her license in about a month, and we will probably end up buying two handhelds in addition to the mobile.

My questions are as follows:

1. Does anyone have any feedback on the advantages/disadvantages of the Kenwood TH-G71?

2. What other handhelds should I consider, and why would they be better than the TH-G71?

3. Any feedback on the Kenwood TM-G707A versus the Icom IC-706 MKII?

4. What other mobiles should I consider other than these two, and why?

Sorry for all the questions. As I mentioned, I am just getting into the hobby, and seek your collective expertise.

Thanks in advance,

Brien P. Crotty
(Already impatiently waiting for my callsign)

Message-ID: <FCIN1.103$Hi3.210704@news3.ispnews.com>
Source record: 131408
Cross-posted to: alt.ham-radio,alt.ham-radio.hf,alt.ham-radio.ssb,alt.radio.amateur,rec.ham-radio,rec.ham-radio.swap,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.swap,rec.radio.swap

I have the following equipment

FT-101B = about 20 hrs = 9++, mic and power cord
FL-2100B = Amp = 9+
FV-101B = VFO = 8.5
YC-601 = Freq. counter = 8.5
YO-100 = Scope = 9
FTV-650B = 6M = 9
FTV-250 = 2M = 9
YP-150Z = Dummy load/Watt meter = 9 (rare)
YD-844A = Desk Mic = 9+

If you are hunting a very nice near complete station here it is and this one won't be here long !

You would only need SP-101 Speaker or SP-101PB Phone patch and QTR-24 World clock to complete station http://www.qsl.net/nw2m/ as seen here.

I would like to sell as a complete set, but "might" consider splitting up
e-mail me at bfd@lebmofo.com

From: WB3KJX <wb3kjx@pc-intouch.com>
Message-ID: <01bde52e$7e62c360$2fc6d4cf@default>
Source record: 131411

That's a broad question! Antenna's and propogation are a major science. Basically, "any antenna is better then no antenna at all." For VHF/UHF, ground planes and beams are great. Depending on what you want to do (FM/SSB/ATV) etermines the polorization. For HF, verticals are good all around antennas (great low angle take off for dx) but pick up man made noise more then a dipole (bi-directional). There are literally hundreds of antenna designs out there, each with good/bad points. Then you gt into beams, quads, loops, etc. What specifically are you looking for? If you're interested, the ARRL antenna book is a great source of information.

4982. Help changing Tektronix Scope to 230 Volt line vlotage

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-21 00:00:00 UTC
From: Chris.Muriel@analog.com
Message-ID: <36062ee3.12898789@analog.com>
Source record: 131420

I bought a Tektronix 7603 Oscilliscope + some plug-ins yesterday at
the Fleamarket at MIT.
I was hoping to find a simple internal switch marked 220/110 Volts
but no such luck !!!
Having got it back to England,can anyone tell me how to set it for
our European 230 Volt line voltage,please ???
I've spotted some shorting plugs which can plug into 1 of 3 rows of
pins ;they're marked "Hi" , "Med" & "low". I wonder if this
correctly alters the transformer tappings.

Chris Muriel (G3ZDM) ,Manchester,UK

Too many radios...

Motorola system saber VHF, excellent condx. 146-174 band
range. Includes radio, battery, antenna. No secure module.
(and I don't have a charger).
System saber is like regular saber III, but does a whole
lot more stuff.

$700 will ship. Prefer prepayment, have references.

4986. Need Information on Motorola Pager

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-21 00:00:00 UTC
From: Douglas Berry <dberry@wcl.on.ca>
Message-ID: <6u5lvf$44l$1@demon.uunet.ca>
Source record: 131424
Cross-posted to: rec.radio.amateur.equipment,sci.electronics.repair

Hi

Name here is Doug VA3DMB

I am looking for any information (schematics) on a Motorola Pager to convert
to 2 meter Simplex. The pager was on 166.680 and has a clip in vibrator.
The numbers on the outside of the case are

A03FAB4568AA TYPE FAHA NO 109011077
166.6800 MHZ MOTOROLA INC.
616BNG1063

Inside on a label on the PC board is

Korea 8820 NRD6855AN 1 TD289

And printed on the PC Board is the number 6855

I came across this pager quite cheap and thought it would be fun to try and
convert it to 2 meters for local use in ower small town. Any information
you could provide would be appraised

Thanks again Doug VA3DMB

4993. Re: ICOM 706 - Maximum length for control head cable ??

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-21 00:00:00 UTC
From: "Michael St. Angelo" <mstangelo@worldnet.att.net>
Message-ID: <01bde578$e66bc2a0$a1604e0c@mstangelo>
Source record: 131431

Gordon,

I asked ICOM about providing a longer cable. They stated it was not
possible.
There was too much voltage drop in a longer extended cable to operate
the control head reliably.

If voltage drop is the issue. You might want to fabricate a longer
cable using wire with a larger gauge and try it out. The stock
cable is probably shielded; the new cable should be shielded
in the same manner. To be on the safe side, I would place
ferrite chokes on each end of the cable to minimize
RFI pickup.

You probably cannot purchase the connectors. You may
have to cannibalize a stock cable to fabricate the
longer cable.

73, Mike N2MS

One week ago I requested this mod. Because I found it in the meantime I'm posting it now. I wasn't able to try it, because I am 'only' going to buy the Radio in one or two months. So if you try it please give me shout ...

Yours, Ben - DH3BEN

1. Open the device by removing the two screws on the rear.
2. There are two resistors, RD45 and RD46, located under the display.

Removal of RD45:
RX-Range: 100.00 - 199.995 MHz
TX-Range: 144.00 - 147.995 MHz

Removal of RD45 & RD 46:
RX-Range: 100.00 - 199.995 MHz
TX-Range: 100.00 - 199.995 MHz

Attention ! Removal of RD46 will erase all memories.

Owner assumes all responsibility for modifying or using these modifications !

I have a Dentron GLA-1000B and a GLA-1000. Both 1KW input, clean and in good condition. Both work but can use a set of tubes for higher output. Normally 450 watts output they are a bit lower than that.
Both have Four 6LQ6 sweep tubes. They cover 80-15 meters with 10 optional. Manual included $200 each plus shipping. 73 Chris

5007. Ameritron ALS-500M Mobile HF AMP

For auction on ebay:
Kenwood SM-220 Station Monitor /w BS-8 Pan Adapter!!
see it here:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=31419790

Station monitor scope with BS-8 Pan Adapter for spectral display of nearby frequencies (band scope)! This scope is in nice shape, (there is a scratch on the top of the front bezel, about 1" long) and works well. No burn marks on tube. Includes original manual and original box. A GREAT station accessory, for Kenwood or any station. A MUST if you use an amplifier. (Trapezoid pattern shows clipping.) Please note that most functions will work with any station, but the band scope function requires a Kenwood radio.

Buyer to prepay with US Postal Money Order or Certified funds.

Buyer to pay actual UPS shipping costs from Roswell GA, 30076

Harold,
While you are conducting your investigation, why don't you do a search of the Dejanews files, in the search field enter Roland Geter and you will get plenty of hits about your buddy Roland Geter and his business dealings, bad checks, items never paid for, etc., etc. Just today (9/21/98) another posting from a guy who got a bad check from Roland Geter in Arizona and filed a complaint with the Glendale Arizona District Attorney's Office. It took five years for the victim to get his money...isn't that great! You can contact the D.A.'s office for Glendale Arizona, bad check division to verify it.

Do your homework before you start defending someone....
Piero

From: Mike King KM0T <scsueepe@mtcnet.net>
Message-ID: <6u6t2atm1@mtc1.mtcnet.net>
Source record: 131466

Hi there fellow ops,

Getting back into the hobby once again after a long time away (uhhhg Cycle 21) Anyway, was rearching new rigs. Do you like the Icom rigs? After reading the ARRL reviews, the 746 looks like the best bang for the buck, but it would seem that the 756 would be abit better performing rig on HF and 6M than the 746... The 775DSP did not get a real favorable review in QST...but have they improved it since the review?

What about the Yaesus? The FT1000MP? Have looked at the kenwoods, but dont really like the selection.

Any rumors of new HF rigs right on the horizon?

Thanks everyone for your help!

You will never see anyone in the U.S. take you up on that. No one can
legally sell that high a power without exporting it to another country.
It would have to be FCC type accepted.

Source record: 131271

Hello,

I have for sale a Mirage B-310-G 100w 2 meter Amp. It is great for hand-helds and can take 250mw to 8w input for a max of 100 watts output. I purchased the Amp to go with my ICOM 706MkII but seems I'm using less 2 meters lately and more HF. The Amp is in the box with manual and jumper coax to connect to a SO-239 or a BNC connector. The Amp has its own cooling fan and can be used on the FM, CW, and SSB modes. It also has a built in GaAsFET Pre-amp that really helps strenghten those week signals...

Asking $150.00 I'll ship cont. US/COD

Thanks and 73!

There's a couple of things you can try:

1. See if there is a label on the old radio that shows what each wire does (although it sounds like you may have already done this).

2. See if you can get an adapter cable to go between the new radio and the original plugs. They are fairly common for some lines.

3. Run new wires as needed to 12 VDC, ground, ACC, and speakers as needed and leave the original wiring in place.

Good Luck and 73 de KD7MK

Hi
Looking at the micro-HT's....very interested in the VX1R, esp since it has really wideband receive. Looking for feedback from owners...particularly regarding its AM & FM B/C band performance, receive performance in the aircraft bands, 220MHz, etc. Also interested in hearing from owners of other microHTs. Who's selling them for the lowest price?

5043. Protest to the FCC!!

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-22 00:00:00 UTC
From: captain_crunch@my-dejanews.com
Message-ID: <6u93eo$ji4$1@nnrp1.dejanews.com>
Source record: 131281

There is a protest afoot in this great land!
A protest to the FCC. We want to send a message
to them that we are sick and tired of their
lack of enforcement! We want to send a message
to the FCC that we're tired of the garbage!
The more people who participate in this little
protest, the more we send a clear message to the
FCC and Congress that we're mad as hell and we're
not going to take it anymore!

The protest is easy. Just say your callsign
backwords! Nothing cryptic or illegal about
that. Anyone can easily figure out who you
are. But imagine if thousands of hams started
giving their callsigns backwards! It would be....
revolutionary!

I know....it's only symbolism over substance....
but it just might get their attention!

Example: W9ABC becomes CBA9W

Now...go take on the day.....

> That may be because the RF is getting back into the osc.

No, most often it is because capacitance of the track coming
from the top of the tuned circuit (amongst others) is changing
as the PCB is moved around. Half freq. VFO's don't 'pull',
yet they must be mounted in a metal case for reasonable stability.

> It's pointless to use a counter to set the freq on something that isn't
> going to stay there for more than a few minutes. It's just as easy to
> set the freq to correspond with the dial on a FM tuner.

_If_ getting within 25kHz is 'good enough'. I don't think that it
is in these days of digitally tuned radios. In some cases you need to
be within 10kHz on the fringes, or the radio mutes.

Martin.

Dan,

You are right about the kill file. It works very well. However, I do not
know if you can create a kill file when using the newsreaders in Outlook,
or Netscape, or if your are reading from Deja News. If you are using
Newswatcher on a Macintosh, a filter can be created for pretty much
anything you don't want to see. I believe that Free Agent for the PC can
do this also.

Date: 1998-09-22 00:00:00 UTC
From: qsy220@aol.com
Message-ID: <19980922173810.03768.00000240@ng-fd2.aol.com>
Source record: 131289

This looks like a standard coaxial DC power connector except there is a small male pin inside the hole in the plug. This is the same plug that is used on the Icom BC-77A wall charger and CP-13 cig. lighter cable that are used with the IC-W2A, IC-2SRA, IC-4SRA, etc. The plug barrel measures about 0.198 in (5 mm) in diameter and is about 3/8 in (9 to 10 mm) long.

Need a source for these plugs. Please reply via email.

Thanks, Bill.

> be within 10kHz on the fringes, or the radio mutes.

Well, that's the whole point I'm making. You can set the freq with the
counter all you want, but no sooner than you finish setting it than it
starts to drift and soon will be off freq. So I don't see why someone
would go to all the trouble to get a freq counter to adjust it, and then
have to keep adjusting it very often.

It's easier and quicker to set the receiver to the wanted channel, tune
the VFO to the top and bottom of the channel where the receiver loses
the lock on the signal, and then set the VFO halfway between these
points. Or use a regular analog receiver with the AFC disabled.

ANd remember that the above assumes you have a cheapo VFO. If the VFO
is well designed and built and is stable, then it won't drift and the
counter method will work okay, and it'll stay on freq for a much longer
time.

Good luck finding the HF200 Dentron. I think they only made 400
of 'em. There were other rigs that Dentron Advertized as well.
Scout around old issues of QST, CQ, Ham Radio and HR for the
descriptions. There was also a 160m transmitter which was sold
last month on the auction..

Source record: 131312

I have been out of the radio market for quite a while.. (I've been happy with my Icom 2410) but I have finally bought a new car (98 Sable) with NO room for my 2410 on the floor (or anywhere else) and need to buy a remotable head radio to make it all work...

I live in Milwaukee, which is a pretty RF dense environment as well (just to complicate things a little)

The price is right on the Yaesu FT8500, but what kind of reviews have they gotten? Is that big ugly mike really functional?

How about the FT-8100 or Icom 2710? Both are several hundred dollars more than the 8500s are currently...

Thanks!

W9JUC 10 Meter activity today

Aside from pipeline into ZS land the last few days it was a pleasant surprise to hear and work the following stations on my homebrew DELTA LOOP ANTENNA.today.

South and West Africa were active until 1615Z at this QTH (near Chicago IL)

1627Z IZ8BRI Egi Southern Italy S9
1630Z Z31JA Venco East Macedonia S5
1640Z G0XAM /mm Les near Sicily S5
1644Z TK5PB Bruno Corsica S7
1744Z IK6SNR LU Central Italy S9+5
1745Z IZ6CLZ ANTHONY Central S6
1746Z IZ6BJL ALEX near ROME S9+5
1755Z IK5SRF PAULO Livorno S8
1806Z EA7HBP SALVA SPAIN S9+

New Zealand and Australia made their daily appearance begining at 2200Z.

Nothing heard out of The Far East or Central
Asia today on 10 meters.

Unfortunately I was unable to monitor 10 meters all day today but as Scarlet said," Tomorrow is another day".

You can view my TEN METER DELTA LOOP ARRAY at

http://homepage.interaccess.com/~jpearl/DeltaXray.html

>73 de Jason Togyer KB3CNM

If there is a ribbon cable soldered to the board, check it. I had a PLL doing that on another rig and it turned out to be one broken wire in a ribbon cable at the place it is soldered to the the board. Since I had dropped this rig the vibration was the likely reason, but it didn't show up right away, and later developed symptoms like you describe.

5079. Radio replacement in 1990 Volvo 240 wagon

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-22 00:00:00 UTC
From: pkeshary@my-dejanews.com
Message-ID: <6u6s89$8v7$1@nnrp1.dejanews.com>
Source record: 131330

I am trying to replace radio in my 1990 volvo 240 Wagon. I don't have electrical diagram of the harness which went into the factory installed radio. It also has a amplifier which I don't need to use with the new radio that I intend to put in (I have a 4 x 35 W radio that I want to put in). Without the electrical diagram for the radio harness, I don't know what is what, where is the cable coming from the 4 speakers. As a layman when I unhooked the radio, I detected the following connection to the original radio:- 1. A thick black cable coming out of the "Ground" of the radio and going into the Amplifier. 2. A thicker black cable coming out of radio (6 prong round plug, pre-amplified signal) which goes into the amplifier. 3. A hole where I think the antenna cable goes in. 4. A white plastic harness which is square in shape and has 9 connecting holes in it. But only 7 holes are used- other 2 are empty. Of the 7 wires, I could identify only 2 - one is for 12V power and the other is for 12V ACC circuit. I don't know what other 5 wires are for. 5. A flat looking harness which has only 2 wires. I don't know what they are for.

In my new radio which I am going to put in, it has following terminals:-
1. One goes to Car battery + terminal
2. Other goes to ACC circuit
3. Ground
4. There are 4 pairs of wires. Each of those pair connect to the + and - terminals of each of the 4 speakers.

My problem is how to connect this new radio to my volvo. My main problem is how to Identify wires coming out of + and - terminals of each of the 4 speakers (a total of 8 wires). I don't know where they are.

I would appreciate very much if anyone can help me out here. Thank you for attention and time.

So you're saying amateur radio has no role in emergency communications, that we should leave that to the official emergency services agencies. But they're overwhelmed, that's why they need us in the first place.

You're saying that we only serve a post-emergency role in moving H&W traffic. But one of the first things FEMA does now is fly in flyaway satellite uplinks to get LD service back on line. Typically, they set up public phone booths in the area where people can call out to reassure Aunt Minnie in Frostbite Falls that they're Ok. That happens within 24 hours in most cases. The amateur H&W traffic handling system backs up and often requires many days or weeks to move the same message. Face it, we're obsolete for this role today. (That doesn't have to be true, but we have to rethink the way we handle this job if we want to remain useful in this area.)

Where we provide some value is as first responders, and as additional eyes and ears providing tactical information during and immediately after the emergency. That requires a point presence. Just being in the general disaster area isn't sufficient. But we're thin on the ground today compared to some other radio services, so we often aren't on the scene for these tasks, and the job has to be handled some other way by some other group. We wind up being left out in the cold.

Because of our training and skills, one of the better things we can do is to act to tie together the various other systems which are thick on the ground, and which are on the scene, into a more coordinated response network. We need to enlarge our view of our task to include the larger

scope of communications systems available today, and start to figure out ways we can utilize them, and they utilize us, so that the whole complex of systems better serve the community.

Among other things, this means that we need to become intimately familiar with the other radio systems in use in our area beyond those belonging to amateur radio. We need to be able to use a trunked system, use a cellphone, use the internet, use CB, etc, in addition to our own systems. And we need to be able to act to tie them together in useful ways when necessary. To do that, we need to know what they are, where they are, and how they work.

If your county EMA handed you a public service trunked radio and told you to liason with them, would you know how? Could you quickly integrate the local taxi company's dispatch system into the emergency net? Would you know what to do with a flyaway satellite pack? Etc. You're not much use today if you can't.

Hello All,

I've got a Drake R4B that has a 'loose' PTO - I describe it as loose because it seems to want to bounce around a bit - I've read that a loose end cap on the PTO coil can cause that kind of behavior - but I can't figure out how to get the cover off of it to see! So how do you get the cover off? Do I just need to quit being a whimp and crowbar it off? or is there something I'm not seeing?

Thanks!

Bob - N2YRJ

5094. ***ANY TRICKS/MODS/CELL ON ICOM Q7A?***

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-22 00:00:00 UTC
From: teenham@aol.com
Message-ID: <19980921234400.03301.00000404@ng141.aol.com>
Source record: 131345

Hey,

I am looking for any interesting information on the new ICOM Q7A mini HT. I have searched DejaNews, search engines, but really didn't come up with all that much info. Although I did find the schamatic for the OPC-782 Plug at <http://www.hamradio.cz/rigs/Dilna/icom/OPC-782/index.htm> There is more info on that page on the Q7A, but it is not in English. I have seen a *REALLY* cool "unofficial" page on the VX-1R, but nothing on the Q7A. Someone should start an "Unofficial ICOM Q7A Page." The only "trick" I have found which is undocumented is you can hold down BAND at power up and the LCD test will run. Hold the BAND button for as long as you want all the characters to be lit up. Anyone got any others? Any comments on getting cellular reception on the Q7A? Images? Possible full band restoration? Please share your thoughts here, and please also email me with them (AOL really isn't the best server, you know...)

Take Care

I hope I am not being presumptious by writing to you. I'm guessing that you know about Halllicrafter's radios. I just bought my first, an SX-99. I need to know about sources of things like knobs, schematics and parts, especially an operating manual.
Thanks in advance for whatever time you can take to answer.
Regards,
Mike Christie

There used to be a place called Ham Heaven in Waukeegan (I think). I
bought a used HT from them in 1992. Not a bad place but I don't think they
are in business anymore:-(
You could wait for the Lake County Ham Fest and get just about anything
your wallet can handle.

Later...

Allan;
The 2000 had goood receiver rep. for Intermod rejection. The 2100 is = plus 55 w xmit.
I just bought one at Shelby NC Hamfest from RT Systems; $180. ! All others were 199.

So far so good; even 199. at Texas towers was appealing to me before the Hamfest.

Source record: 131362

Mike;
Ur doing well on 746 homework.

First , don't buy a new model from Japan as soon as it is introduced; many have gremlins first 3 months. I think the 746 gives good value,
and one of our contester/Dx chasers loves his.

The 756 is a better HF rig with 6 m as a good opption. Not convinced I want 2m & UHF all in my HF rig.; 6m is enuf!

The 1000MP is overated & I lost $375. last year the hard way on one. INRAD now offers a receive mod to help it. I think a near 3K rig shud NOT need any after market help ! And haing to redo the menus each time you need/want to change a feature is garbage.
Beware of seri.# under 2400 or 2500 on the 775DSP.
I am now happy with all 5 filter slots filled in a one year old Ten-Tec Omni VI Plus. DSP etc. is great. I ordered this after several months last year, & had to wait for second production run. And they really speak true English when I had a couple of questions, HI. In case you don't know, they offer a 30 day trial use, then your out shipping costs if U return it.
Many Ten-Tec reflector readers are urging them to add 6 meters to the next rig, presumably an "Omni VII".

GL-They are'nt cheap !

Jim, K4SQR

5112. Using 811's in place of 572's

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-22 00:00:00 UTC
From: WmD <wds@raex.com>
Message-ID: <3607ABDC.765A@raex.com>
Source record: 131363

I've seen some articles in the ng's regarding certain instances where 572's can be used in place of 811's. Realizing that the 572B is a heftier tube, would it be possible to use 811's instead of 572B's in a Heathkit SB-200 (accepting lower power output, etc.)?

Thanks,
Bill

One obvious way to obtain such skills is to affiliate yourself with the
agencies which use those techniques. Then you'll receive cross
training in the use of the equipment.

From: Jim <amcastmis@earthlink.net>
Message-ID: <3609562A.3C6C1C98@earthlink.net>
Source record: 131173

Personally, I took it to be a bad review. For economic reasons (read, advertising dollars), you'll rarely read a scatching report on any product in QST or any other advertiser supported magazine, the only other report I ever took as being as bad was the Patcomm 1600. I don't quite 'get' what this radio (2020) is all about anyway. Size wise, there are many other radios that aren't significantly bigger and boast such niceties as 100 watts out, hot dual conversion receivers, sometimes 6 meters, sometimes even 2 meters, etc... Price wise, again lot's of competition at todays soft retail prices, not to mention some of the absolute steals available on the used market right now. I heard one fellow on 20 meters (sorry, don't recall his call) the other night using one and he wasn't too happy with his. His exact phrase was 'a big rip off'. I guess you have to take that for whatever you think it's worth, we've all been unhappy with products at one time or another while the next guy loves it! My feeling is, if ya got $600+ to blow and just want to play with a new toy, buy it. If you want a satisfying long term radio I'd personally look at alternatives. OK, bring on the flames now.

I used to have a liquid made for such a use...I got it at a "high-end" audiophile/stereo store. It was made for record turntable covers (THAT'S how old it was...). I'll try to dig up a source.

I have heard stories of folks using fine silk shirts or ties to gently "rub out" minor scratches in plastic lenses, too.

> Maybe getting a mobile instead and use it as a base a better idea?

More "power" might not necessarily satisfy you, though, if you are not using an efficient antenna system!

I'd rather see you spend some bucks on a good antenna first (you'll be getting one anyway...) before looking towards more power. Sometimes, just getting that antenna up 20 or 30 feet with as efficient cable as possible makes THE difference!

What area do you live in? Are you hitting repeaters now with an HT? Make sure what you want to do on 2M/440 is achievable!

You're right about the timing, Bill... I didn't realize they'd been out that long. Seems like four months ago I was interested but they weren't shipping yet. Time flies!!

I did go back in dejanews and find some old posts. In general, people were saying the 599zx outperformed the DSPs in the new rigs, which I found curious.

Yep, I knew about the reorg at TimeWave. They have such a great product line I'm confident if they fold, someone else will buy out and carry on the line, as was done when AES folded.

I ordered one today with the right to send 'er back for refund if I'm not happy.

Thanks... Ed, W5EJ

The review was positive! You were asked to keep in mind its price. The radio is designed to take a beating and from what i have seen of it at Dayton it will do so. It may be the only radio that can stand a 10 foot drop. There are used radios that sell for near its price but they don't usually have the same features... QST's worst reports were for the NRC and Icom 706 (old style). Those were from two heavy advertisers

5136. Suggestions on amp design?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-23 00:00:00 UTC
From: l2jarvis@mindspring.com
Message-ID: <36098a35.36380006@news.mindspring.com>
Source record: 131190

Hello,

I'd like to build an amp for my recently completed 20M SSB QRP rig; something in the neighborhood of 25W. I've found that 2 watts will do wonders on CW, but not so for SSB!

I'm considering an MRF426 (NPN bipolar 28V, 50mW in, 25W out), but would prefer a push/pull arrangement with two devices in a TO-220 style case case. This would require that each device dissipate about 25W each. Can a TO-220 case do that?

I'm not adverse to FETS, though I've never built a FET amp. I saw an interesting circuit using two IRF511's, but that device is very inefficient above about 10MHz.

Any suggestions?

Thanks, and kind regards,
Lee - KN4VN

5141. Kenwood TS-140S Opinions\Accessories Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-23 00:00:00 UTC
From: Kevin Fisher <klfisher@compusmart.ab.ca>
Message-ID: <3609b0cb.0@ntnews.compusmart.ab.ca>
Source record: 131195

Hi,

I recently purchased a used Kenwood TS-140S and am finding that the
stock unit performs quite poorly. I have a 20M dipole and can only receive
the kilowatt stations.. even they are very poor. Is it just me or have other
people found this ?

I am also interested in opinions in optional filters (Both CW and SSB). Are
the
Kenwood filters YG-455C-1 or YK-455C-1 fine ? What are the differences
between the two and which filter is better ? These appear for CW, are there
any
filters for SSB ? I would be interested in other manufacturers also.

Any help would be appreciated.
My first glimse of HF is disappointing and would like to change this ..

Thanks in advance

Hell, the Federal "Communist" Commission enforces TOO much. This is supposed to be a FREE country, where FREE SPEECH is declared in our Constitution. We don't need the Commission patroling the frequencies ... we don't need them at all.

If you want to protest the Commission, don't stop by just saying your callsign backwards. Hell, don't say your callsign at all!!

Article 1, of the Constitution of the United States
Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the FREEDOM OF SPEECH, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

U.S. Code Title 47, Chapter 5, Section 326
Nothing in this chapter shall be understood or construed to give the Commission the power of censorship over the radio communications or signals transmitted by any radio station, and no regulation or condition shall be promulgated or fixed by the Commission which shall interfere with the right of free speech by means of radio communication.

Part 97 be damned!! Our own United States Code prohibits any type of regulations or censorship, enforcement, or anything else. It is right there, plain as day.

Hi Sid,
Prime example of the problem I have been having with the most simple purchases!!! I have not been at that location for quite some time since I have been summer traveling. Since you apparently didn't send the items COD CASH ONLY my secretary thinks its all right that you think she's clairvoyant .....but she asks would you mind including a return address for a remittance? (smile)

Do you remember which tubes and quantities you sent? I have a couple volunteer technicians rebuilding four older Doppler traffic radar units for donation to a couple surrounding low budget municipalities. I'll check it they have been opened and used yet. Please be sure that 25 bucks included some shipping, OK?

Where is your vacation account taking you.... South for the Winter or North for the Summer? We leave Phoenix (permanent home) during 120degree Summers then return for 80-85degree Winters.
Thanks,
Roland S Geter Sr

Source record: 131224

Jorge, I just did the bulb replacement on my Ft-2400 this week..... Remove the top cover.. you have 5 screws 2 on each side and 1 in the rear. Remove the display with a 3mm hex key then remove the black wire that runs from the display board to the connector board (the board under the top cover that was just removed) the screw is on the left hand side. Then remove the 3 screws holding the display board to the desplay housing. Remove the 3 front knobs and the display board will come out of the housing.

I used 6.3 volt lamps for the replacement..
You will see on each side of the display the lamps, I used a regular old Heathkit soldering iron and removed both lamps, be sure to remove the white lamp filter before you unsolder the lamps from the display board..

The whole job took about 1 hour to complete
and the lamps came out and went in rather easy..... 73 Rick WB5YTG..

Thank you to all who replied, on the ng and in email -- and especially
to Ed N1IXB, who sent the repair and owner's manuals.

Incidentally, the problem seems to be a cold solder joint or a broken
trace in the PLL area of the main board -- the PLL is unlocking
intermittently, and pressure on that area of the board makes the problem
come and go.

This is has been pesky to cure so far, but thanks to you folks, at least
I have a direction now (like knowing *which* area of the board the PLL
circuitry is in!) and some background about how the radio works.

Ah, these hamfest "bargains"...

I have a dual band HT... cannot afford a real base station for more power. I was looking at this Maha docking booster solution. Is this a good idea? How well does it work?

Maybe getting a mobile instead and use it as a base a better idea?

Any advice would be greatly appreciate it.

The MAHA docking booster basically does what it say it does - provides RF gain, a place to mechanically hold your HT, and HT power. I used it with my HT as a "base" at home for a while.

However, a HT on the MAHA still has a few problems:

- Once your HT is mounted on the MAHA booster, you can't pick it up. You really need a speaker mike.

- The speaker in the HT or the speaker mike isn't wonderful - you'll get much better audio if you hook up an external 4 inch speaker or so. But then the HT probably only has 200 mW or 500 mW of audio output - maybe you should make that an amplified speaker if the room is noisy.

- Mobile rigs are usually more resistant to intermod than HTs - they have more space for filters, and can use all the current they want in the amplifying stages.

- The display on a HT is small and hard to read at a distance.

- If you run full output power and have long conversations, the MAHA case (heat sink) gets very hot. You might want to add a fan.

In comparison, a mobile rig comes with a separate mike. Recent designs often let you control many of the functions of the radio from the mike, too. The built-in speaker is better than a HT's, and there is several watts of audio power for driving an external speaker for even better sound. There's probably less intermod. Mobile rigs either have a fan, or a huge heat sink. The display is large, and the buttons and knobs are also larger and easier to use.

If you can't afford a mobile radio, the MAHA does indeed work. To MAHA's credit, you can even do cross-band repeating if your HT is capable of that. The MAHA dual-band booster leaves the UHF receive path open when a VHF transmitted signal is being amplified, and vice versa.

But a mobile radio ultimately makes a better "base" station. In my case, I used the MAHA for a while, until a suitable used mobile radio came along (an Icom IC-2350H).

I'm pretty new to HF with my recent upgrade to Tech Plus. I was listening to 10 meters today and heard a JA7 call. I replied and it turns out this station was in Japan! I thought he said KA7 at first (hihi). Imagine my surprise contacting a Japanese station! Well, now I'm stuck looking up his callbook info. I tried www.qrz.com and it only has info on US and a few select countries. Where can I find a callsign database that has Japanese callsigns? Or even better, somewhere that has all international callsigns.
Thanks for your help.

Cross-posted to: rec.ham-radio.swap,rec.radio,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.commercial-lmr,rec.radio.swap

Well, I have rec'd a lot of mail and see some posts about a listing I placed... not sure what all groups. I've had some trouble with my server the last few days and it has apparantly had a seizure and belched out 20 copies of the same post...(I assume this is the problem.. the upset individuals are not great communicators...) I've posted, bought and sold here for some time and never dreamed that something like this could happen, I've always met intelligent, polite people.... what the heck happened???
At any rate, I must apologize to the group for any hang-ups the problem has caused, whatever it was. Could someone of better temper and maturity please email and let me know if there truly is a problem and what I can do to fix it? I would appreciate it.
As for the folks who emailed and posted those beautifully worded messages.... I say this: Before flying off the handle on someone about something that is (to me) not a life-changing experience and no big deal, you should have asked, instead of posting a useless msg and wasting even more space....like an idiot, no? It never ceases to amaze me, how quickly people feel free to act 'tough' when they assume the other person will never be standing in front of them in 'real' life..... You don't know me or who I am. I could be living in walking distance of you. You need to grow up, get up from your computer once in a while and not take this so seriously... None of it will matter in the large scope of things, anyway. There's a whole world out there, full of real people. Go check it out sometime.
It's funny..... 20 people who have no idea who I am are feeling free to be rude, and not one person pointed out the problem or asked if it was an accident or if I needed help.. I 've managed to piece together what it was anyway. thanks a lot, guys.
Again, if there truly is a problem of some kind, I apologize to the group.
Sorry I had to post this msg as well.
thanks,
Randy
p.s. Thanks to the folks who answered the posts... I'll be getting back to ya as soon as I can.

I have 2 Radius M-216 UHF mobiles for sale. 16-pin, 25 watt.
Both are in mint condition and have never seen
rough service.

One was used as a base station since new and comes
with power cable, mic, mic clip, base mounting tray.
Model: D34LRA7PA5CK Ser: 778TTL0684

The other was used in a mobile application and comes
with mounting bracket, mic, mic clip, power cable.
Model: D34LRA7PA5CK Ser: 778VQW1819

$275.00 each or $525.00 for both plus shipping.

I also have a limited number of new & unused Motorola
Radius, (M1225, P1225, GM300, GP300, etc VHF & UHF) for
sale at almost dealer cost. These are USA models.
Not export/import. M1225 UHF would be $425.00 plus
shipping for example.

Kenwood TK-760, 860 mobiles and portable procucts also.

If interested in any of the above, email for details
and prices.

ADC Telecommunications has just introduced a solution, GSM network on wheels (NOW). The GSM NOW is an entire GSM (global system for mobile communications) microcellular-based mobile network system that can be installed in a standard stretch cargo van, allowing carriers to establish service directly in areas where temporary wireless coverage is needed.

GSM NOW is ideal for conventions, sporting events or other large events, providing seamless capacity augmentation. It can also fill temporary capacity needs -- such as those required under emergency conditions -- to provide coverage for critical services.

Another application is for use during lengthy settlement periods or moratoriums in areas where cellular tower construction is being delayed.

Unlike its mobile counterparts, such as COWs (cellular on wheels), the GSM NOW is a complete network, which consists of a switch (MCS), controller (BSC) and transceiver (BTS). In addition, the GSM NOW is powered directly from a standard 220VAC source or -48 VDC batteries rather than requiring a separate power bay. GSM NOW may be adapted to fit into a standard sports utility vehicle and ADC will create custom configurations to meet specific operator requirements.

>

Please help me understand this muting.

The FM bandwidth is atleast 75 Khz,

There is obviously enough signal strength 10Khz away from carrier freq

The Q of the receiver cannot be so sharp that it kicks in a muting circuit for
only 10Khz off tuning. I am sure if it was that sharp, it would have bad
effects of a regular station when properly tuned.

In any case, i would not discount a good free running VCO for hobbyists just
because it sounds bad at the remote fringes. If it is OK for 1-3 Km , who
cares about 25-30 Km ?

>Spasofcly colors like black and dark gray?

>Zach Bender KC7KRO

If the plastic surface is smooth or polished (and the scratch is not a deep gouge), you can use very fine-grit sandpaper or rubbing compound (some toothpastes work as well) to sand out the scratch and use plastic polish to restore the finish and blend it back in with the surrounding surface. This works for display windows.

Otherwise, use modeler's putty and sandpaper to fill in the crack or gouge and repaint the surface.

If it is a textured plastic surface, I don't know what you can do short of using one of those textured level/vinyl repair kits they used to sell on T.V.! Almost everything you attempt on a textured surface will most likely be more visible than the original scratch!

How about finding a wood finisher's or furniture putty that matches to color of the plastic? Simply spread it into the scratch, then using a rag and some rubbing alcohol wipe the putty off until things look better?

>Do you mean that the average digital receiver DOES NOT have AFC?

That's basically correct. There is no need for AFC if the receiver can be maintained accurately on frequency, and that's what digitally tuned receivers do. They are designed to receive FM broadcast stations, and FM broadcast stations don't drift much. FM broadcasters are required by law to maintain frequency to a tolerance of less than 1 kHz, and most do a good bit better than that. That same tolerance is fairly easy to maintain with a digitally tuned receiver, so no AFC is required. AFC was necessary for analog tuned receivers due to *receiver* drift, but since that problem has been solved, and since the broadcast stations don't drift, there's no reason to add AFC circuitry to the receiver anymore.

Of course this would be illegal. It is an intentional action to present a callsign that you were not assigned. AW1W is NOT the callsign assigned to the ARRL, W1AW is. This is nonsense.

We surely do need greater FCC enforcement as anyone who has listened to much of 75m, 14.300, 14.313 and the recent jamming and intentional interference to Hurricane Nets may easily observe.

We also need greater enforcement to prevent the increasingly massive violations of power limits on CB and Ham radio. 5KW and greater power output levels with tremendously wide and overmodulated signals make the radiowaves increasingly unfriendly.

IMHO, of course. :-)

BTW: Can we move this discussion to the POLICY newsgroup or at least EQUIPMENT? The SWAP newsgroup is a clearly inappropriate site for this discussion.

Chris,

I don't know about that specific model scope. On the ones that I do know about, line voltage is selected by moving the line fuse to a location that matches your line voltage. In going from 110V to 2220V the value of the fuse must also be changed. My 465 happens to have a switch and three fuse positions.

Good Luck,
Dick

Jason, FWIW, I had a similar, if not identical problem with my Azden PCS-4000 and fixed it by resoldering all the connections in the PLL (basically, everything inside the shielded compartment). I didn't need the schematic -- I just "shotgunned" the PLL. Those Azdens are notorious for their poor solder connections and this is a common fix.

My PCB-mounted NiCad battery has long since given up the ghost. I replaced it with some calculator-replacement NiCad cells "skywired" to the PCB.

Even my grain-of-wheat dial lamps burned out but I replaced them with tiny yellow LEDs (and dropping resistors). When the microphone cable broke under the strain relief at the connector, I repaired that too.

All of this is was encountered over 17 years of mobile operation, which isn't too bad for amateur gear, I suppose. Although not terribly reliable, at least those old Azdens are repairable.

For some unknown reason, _some_ digital receivers do mute in the
presence of small carrier frequency erors. I suspect this is
unintended, and comes about due to the use of noise squelch
circuits which respond to the conditions on the ADJACENT as
well as the wanted channel, i.e they interpret the frequency
offset as interference which needs to be suppressed.

>
> In any case, i would not discount a good free running VCO for hobbyists just
> because it sounds bad at the remote fringes. If it is OK for 1-3 Km , who
> cares about 25-30 Km ?

The fringes can be at 100m if you are running an FM25 or somesuch.
The reason I would hesitate to popularise the VCO is that too many
hobbyists who haven't got a clue will build terrible drifting
monstrosity kits and interfere with their neighbour's radios. The
PLL is quite low cost and gets around a major source of _POSSIBLE_
interference.

Remember, if you want to become a VCO expert no-one is stopping you!!

Best Regards,

Martin.

This all very impressive and informative, but this wonderful technology
would not have been of much use to the citizens and emergency personnel
from Vernonia Oregon, and the surrounding area, during a major flood a
few years ago. The community was cut off from the outside by road
washouts etc. The ONLY communication in or out of the area for approx.
48 hours was Ham Radio. It was used for multiple medical, and other
emergencies, supply ordering, H&W traffic etc.

I am not a "Ham is the only way" touter, but new high tech may not be an
effective solution in all emergencies. I suggest that you consider

making the van you refer to easy to lift by chopper to address roads
that may be impassable by floods, earthquakes etc.

I just did a quick search of newsgroups on this item and the only thing(s) I found were two people trying to sell them. It's awfully early in the game to be doing that.

Has anyone used one who could comment on how well it works??

I own several DSPs, including two of the smaller TimeWave DSP-9's, and really do like them. I'm hoping this later model might cause a bit less distortion of the incoming audio. I'm also wondering if it works against AC line noise or automotive igintion noise?

Any comments would be appreciated.

Thanks... Ed, W5EJ

> to be doing that.

The 599zx has been out for almost two years now. I see FT-847 rigs for sale and they have been out for only 6 months! (or less) So, early or late, all recent makes/models are for sale on the used market.

Some guys probably bought the DSP-599zx to avoid buying a new rig. Once they were able to buy that new rig (with DSP), they didn't need the 599zx. So, they sell it to take some of the bite out of that $2000 price tag on the new rig.

Check out:

http://timewave.com/dsp599zx.html

If you haven't already done so.

One note, I have heard that Timewave has filed for reorganization under the Bankruptcy Code and, I suppose, there is some added uncertainty in their future. But, if you (and others) were to buy some new units, it might make their future a little brighter!!

Regards,

Bill

IBM PS/2 Model 70 386 computers. Ideal for second computer,
packet cluster, digital communications, etc. Just removed from
network service. Most have 2-4 MB RAM, 60 MB HD, and 3.5 "
floppy drive, VGA card, and keyboard. $35 each or four for $100.
UPS charges are $10 each.

Bryan Edwards
Lubbock, Texas

5197. Re: QST SGC-2020 Review

Newsgroup: rec.radio.amateur.equipment

That was as close to a bad review as you will ever see. The author certainly wasn't all that impressed with it. Just for fun you should price the accessories, especially the battery pack. If I recall correctly, it is almost as much as the radio. Just the same, the idea of this radio intrigues me. I'll wait though until others have spent their allowance on it before I spend mine.

ddgsk@tic.net wrote in message <6u9d2e$6mh@news-central.tiac.net>...

5201. Re: Need Source for Icom HT DC power plug

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-24 00:00:00 UTC
From: qsy220@aol.com
Message-ID: <19980924171354.27851.00001285@ng115.aol.com>
Source record: 131074

The correct plug is available at Radio Shack and is catalog number 274-1354.

They have it mislabeled as 5.5 mm OD and 0.3 mm ID (it should be 3.3 or 3.4 mm ID) with a 1.0 mm pin. But it does seem to be the correct one. It is known as an EIAJ Class 4 plug (10.51 to 13.5 VDC.)

Thanks to all who replied with info.

Bill

5202. Re: MMT144/28-R transverter

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-24 00:00:00 UTC
From: qsy220@aol.com
Message-ID: <19980924172933.27851.00001299@ng115.aol.com>
Source record: 131075

The connector is a 5 pin DIN plug with a locking ring. It was used on some transceivers as a microphone connector. I think it is a Switchcraft 12CL5M.

See Newark Electronics catalog 116, page 364.

Good luck,

Bill

Gee, how unusual...ANOTHER person falls victim to Roland Geter's games. The address listed above IS NOT the address of the Maricopa County Sheriff's Office. The actual address of the Sheriff's office is as follows.... Maricopa County Sheriff's Office 102 W. Madison Street Phoenix, AZ. 85003

I'm sure they would be very interested in the above situation about sending the package and not receiving payment. If you want to send a complaint, send it attention Lt. Scott Freeman, Internal Affairs Bureau. I know for a fact he would be interested in your transaction. Good Luck, Piero

I have a Microwave Modules Ltd transverter and need a male power/PTT plug for the back. The manual says it is a 5 pin DIN plug, but it's certainly not one similar to what fits on the back of a C-64. It's more like a very sturdy studio microphone plug. I e-mailed MM, and they say "any 5 pin 240 deg plug will do" I have never seen a plug described that way in any of my catalogs. Does anyone have a more complete spec and possibly a source that will sell me such a plug? Thanks Rick -=-=-=-=-=- Rick Wilson | e-mail: wokt@hotmail.com fax 217 221 6259 | voice 217 221 6137 | ham callsign W0KT espa&#65533;ol | deutsch | italiano

Hi Jerry -- all of the callbooks and QSL info that I have been able to find (50 plus)are at URL:
http://www.ac6v.com/page2.html

As far as I know there is no one source. Buckmaster has quite a few DX calls. Also see the IK4LZH QSL INFORMATION SYSTEM, the DB0SDX -- Managers and Address Databases, the DL5MO QSL Info Databases search -- Three Data Bases for DX Lookups.

Please move this thread off-line so we don't suffer through any more of it in the newsgroups.

It is becoming obvious that Mr. Geter only does business on his own terms - and woe to the person who doesn't understand, or strictly adhere to them. It becomes their "fault" because Mr. Jeter is in denial and now is blaming his "secretary" for not being clairvoyant. Where is his sense of responsibility? I don't expect that people will send me "free" parts - I believe I would attempt to communicate with them (that's what return addresses are for).

(It appears from the comments below that, if you just make up a package and send it "COD Cash Only" to Mr. Geter, his secretary is authorized to pay for it! I know how I am going to clean out my junk box (smile)).

I have had good luck with W&W Associates (they advertise in QST). The
only reason I even went to them in the first place is that their office
is about 6 miles from me and it was a simple matter to drive down and
get the batteries. No waiting. So far they have not disappointed and
in fact I got a good deal last year on a 7.2V 1800mAh battery for my
FT-530 for $35.

5237. Alpha 374 HF Amplifier FS

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-24 00:00:00 UTC
From: W8EK@usa.net
Message-ID: <6udkg7$89l$1@nnrp1.dejanews.com>
Source record: 131139
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors,rec.ham-radio.marketplace

I have an Alpha 374 HF amplifier for sale.

It uses three 8874 tubes (which are in good shape), to easily put out the full legal limit. This is similar to the amp that ETO featured in the ads a few years back, where they put a brick on the key, and left it on for days. It is a very rugged amp!

This amp has a "pretuned" position for each band on the band switch (actually two for 10 meters -- one for the high end and one for the low end), plus a manual tune position on each band. In the "pretuned" position, internal tuning and loading can be adjusted for your particular situation (match your antenna at your favorite portion of the band).

It has the optional hypersil transformer in it.

I have the original shipping boxes, and can ship, but it is heavy. Pick up would be preferred. I am in north central Florida.

Original manual is also included. Cost is $1695, plus shipping from Florida, if I need to ship.

E-mail to W8EK@fdt.net or W8EK@usa.net

Thanks.

I've gotten a used dual port KAM that came without a manual.

Is there anyplace to download a copy of the manual?
A quick diagram of the HF and VHF radio wiring connections
would help get me going

It has version 2.72 firmware installed. Back in the deep recesses
of a dark desk drawer, I found a KAM version 3.0 chip. Any info on
what modes these old versions support?

Any information will be useful.

Thanks - Dave.

Source record: 131146

I've had one for 2 yrs now and am very pleased with it. I bought it for a cronic AC noise problem I get and it eliminated the noise and allowed me to work weak signal rtty again. It's the only DSP I own and I wouldn't trade it for the world.

Don't think you can go wrong buying one.

Hi Al, and others who may be interested,

Get a copy of the latest edition of the ARRL Antenna Book and check out the program MOBILE.EXE that is packaged with it. It allows you to plug in various parameters regarding the design of mobile antennas. A VERY useful program for those who "roll their own." It should be useful for evaluating a "bugcatcher" type coil.

You can simulate placement of the antenna on the vehicle, change the dimensions of the coil, change the size of the antenna components and watch the efficiency of the antenna change. The program will tell you the approximate shunt capacitance needed to match the antenna to the transmission line. In addition, as you change the coil dimensions, you will see the Q change.

If you do a lot of mobile operating, it will be worth the cost of the book for the computer program alone.

October, 1992 QST, Page 45 had a good article on homebrewing large coils for mobile antennas. There have been others, but I don't have a complete bibliography handy.

Hope this helps.

5246. Drake TR-7, C-line, B-line, 2B FS

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-24 00:00:00 UTC
From: ki3b@delanet.com
Message-ID: <6udph3$ej8$1@nnrp1.dejanews.com>
Source record: 131148

Hi,

I'm selling the following:

TR-7 w/ RV-7, Digital Display (DG-7??), Aux-7, PS, copy of manual and service manual. 6, 2.1, and 300 Hz filters, along with Drake 7077 Mike. Good Condition, case is about a 7.5 out of 10, but front of rig is about a 9 out of a 10. $600 complete or BRO* + Shipping

Drake C-line, RX is 23K serial, with 2.1, 500 and 250 Hz filters, Good condition, about a 8 out of a 10, No noise blanker, TX (Don't know serial # offhand), and MS-4/AC supply. With copy of receiver manual and original transmitter manual. $450 or BRO* + Shipping

Drake B-line. Fair condition, Transmitter may need new finals, (~50 watts output), RX seems to be in good condition, with copies of manuals, MS-4 and AC supply. $250 / BRO* + Shipping

Drake 2B Receiver. Needs to have power cord rewired since has 2 lead plug. Case has been repainted, and is in good condition. Works pretty good for it's age. No Q-multiplier/speaker available. $150 / BRO* + Shipping

* BRO - Best Reasonable Offer

Shipping from 19701 via UPS ground

e-mail me at ki3b@delanet.com

Thanks es 73,

Joe

Seems to me that if you want real action you must copy your letters to the folks who control the budget of the FCC - your Congressmen. Most are available via E-mail, though they tend to require a complete address and will reply via snail mail. We are blessed with two US Reps and two US Senators here in NH who are very responsive!
BTW: Should this thread not be moved to the Equipment newsgroup, at worst, and the Policy newsgroup at best? 73, DavidC AA1FA

They're called flyaway packs, Louis. A microcell can fit in a standard airline shipping container. It only takes a few minutes to set up once it arrives on scene. There are also satellite flyaway packs, of course. They take up two standard airline shipping containers, and can be set up in about 20 minutes. Either one can be transported by helicopter if necessary, or by boat, train, airliner, or 4x4 pickup truck. You could pack them in on mules if it came to that (and it did in Afganistan).

FEMA shipped several to Puerto Rico this morning from Atlanta. We did a live remote from the airport watching them being loaded on Delta. (FEMA's relief efforts for Georges are being staged out of Atlanta.)

It'll be interesting to see if FEMA has a handle on coordinating interagency communications this time. A contingent of Forest Service personnel staged out to Puerto Rico this morning too, and all they were issued were Forest Service radios. The government still doesn't have interoperability between agencies' two way radio systems. It may be that cellphones will serve to tie the agencies together. The military had to do that in Grenada. Fire support was done via cellphone because the Army's radios didn't interoperate with the Navy's radios. (I think that issue has been addressed now, but it still hasn't been resolved among the government's civilian agencies.)

You might try getting the attribution correct. I was not the original
poster. I only posted to mention that some US callsigns are still valid
US callsigns even when reversed.

I do agree that the original post was way off-base.

I'm looking for an ORIGINAL (not copy, if I can help it) factory
Service Manual for the Tektronix 465 oscilloscope.

This manual must support serial numbers B250000 & higher, and is so
listed on the cover or spine. The B25 is the important part, I think
there are 4 zeros at the end).

I already have one of the earlier Service Manuals and it isn't close
enough for this particular scope.

Thanks,

Steve

I am an R.F. engineer involved in the design and implementation of PCS systems...we now have picocells, very small and can be set up in minutes and have interoperability with land line or satellite. These will soon become the disaster communication system of choice, based upon number of calls the system can handle, size and cost. However also being a Ham, I would have to say they also have their place in disaster communications and the amateur will not soon be replaced.

From: George Andrews <mauser2@erols.com>
Message-ID: <6uak2psai1@winter.news.erols.com>
Source record: 131203

I am using a dual band HT for 2 M and 440 with a dual band amp. As another has indicated, you do need a speaker/mic. With long QSO's, heating of the amp is an issue and a fan is required. The HT will also become quite hot. Another fan directed at the HT is of minimal help. There is still localized heat build in the HT. I believe routine operation will shorten the working life of an HT.
I operate SSB and FM horizontal most of the time. I use the HT/amp for repeater work that my old Kenwood TS700 can't handle. I do plan to replace the dual band HT with a 2M mobile (or possibly a dual bander) for the FM side. ADI has a pretty decent 2 M mobile under $200. ICOM has the 2100 for $200. with prices apparently dropping, the used market should also drop. Also went the HT route for mobile. Definitely a short term method. It is very tough on the HT.

A TS-440SAT sells for about $600. with no power supply. You might get a 430 for $350. but I'm not sure about that. A power supply by itself sells for around $150. Good luck in your research.

Well, I certainly didn't read it as a positive review, price
notwithstanding. Granted, they didn't tear it apart the way they did
the JRC JST-135 some years ago, but for a QST review it sounded pretty
mediocre to me. I got the impression that the reviewer was trying to
be kind, and having a bit of a hard time doing so.

Personally I'd rather have a receiver with good selectivity and good
performance in the presence of strong adjacent signals than a radio I
can drop off of my house, but those who do a lot of camping,
backpacking, or mobile operation may feel differently. I agree that
the SCG-2020 looks darn near indestructible.

I'd have to agree. The 706 Mk2 is a dandy radio for the money. Too bad I paid 1200.00 for it about 6 months before the ft100 and icom 706G rumours started flying. But I certainly don't regret the purchase. It does everything i want to do (cw, ssb, pactor, rtty) I have used it mobile many times running off battery. Never missed a beat...

I've always been intrigued with the small radios, scout, sgc etc. by the time you get done setting them up the way you want they are almost as expensive as the 706.

Does anyone know the advertised or measured Q of the Texas BugCatcher 40 or 80 meter coils. I have read much of the ARRL publications which depict HF mobile efficiencies which are highly dependent on coil Q (figure or merit).

I also see that the capacily hat is normally placed directly on top of the coil, exactly the WORST place to put it as it detunes the coil-Q due to stray capacitances with the capacity hat.

I had GREAT success with the Stealth HF Mobile Antenna (Fortex Corp) going to the Dayton Hamvention. Mounted to the top of my van, 4 ground straps, 14'overall height, and 100 watts from a TS-50 mobile, we had 100% QSO from the DC area thru Western Marlyand, PA, and thru to Dayton. I was very impressed, and pleased as we addressed EVERY issue the ARRL had to say about HF mobile antenna performance. I also had no idea that moving the base of the antenna from the bumper to the roof doubles the efficiency of these antennas on the 80m and below bands. Yes, the formulas and the math also support the ARRL performance data.

The thing I cannot measure is Q. So, I want to use an existing model (BugCatcher) as a reference. I will try to "roll" my own.

Thanks in advance on coil Q. Post here or email. :-)

Al, NW2M

Is there anyone out there that uses a Harris RF-551A Preselector? Fair Radio and Toronto Surplus have had these for sale for some time. How useful are they? Would they be useful with a Harris RF-590 receiver? I am wondering if they would be of value on 40 SSB at night with the high power AM stations. Any opinions would be appreciated.

How about a SUPERIOR charger...one that will properly charge AND condition about ANY 4.8V-to-12V NiCad or NiMM pack you own right out of the box (no extra "cups" or "adapters")...for about ONE-HALF the price of the Kenwood (and the kenwood only charges one type of battery...)

Get a Maha MH-C777a Universal Charger/Conditioner for fifty bucks. It's the most "intelligent" charger we can get for less than several hundred dollars.

See it at

http://www.maha-com.com

I have both the 709 and 209 with new 1200 ma battery, 600 ma battery, AA battery holder, wall charger, belt clip manual
Both 2 work fine. I will sell the package for $150. Will NOT split up

5298. For Sale: Kenwood R-5000 receiver

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-25 00:00:00 UTC
From: Neil Soane <nsoane@pavilion.co.uk>
Message-ID: <6ugb1q$2a7$1@grind.server.pavilion.net>
Source record: 130982
Cross-posted to: alt.radio.scanner.uk,rec.radio.amateur.equipment,rec.radio.shortwave,uk.radio.amateur

Owing to a forced sale I need to sell my Kenwood R-5000 receiver. It's fitted with the optional VHF unit and has tight filters for CW as well, I will also give my Kenwood filtered external speaker and PC RTTY/CW decoder unit with it. Everything is in exceptional condition, boxed and I have all the sale receipts for view. The whole lot originally cost me £900 or so but I'm willing to sell for £550 or very nearest offer.

If anyone is interested pls e-mail on the address below and I'll ship the unit for free if it's not too far!

Thanks for taking the time to read,

Neil

Problem now fixed -there's a well-hidden jumper that puts the 2 halves
of the primary windings in series & has just 1 shorting loop (instead
of 2 shorting loops - which puts them in parallel for 110 Volt
operation).
Chris Muriel,G3ZDM

5301. Wanted: Millen 90651 GDO manual

5303. FS. High Voltage Transformers

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-25 00:00:00 UTC
From: Dave Pedersen <n7bhc@gateway.net>
Message-ID: <6ugdt2$g77$1@server2.wans.net>
Source record: 130987

For Sale: Two High-Voltage Plate transformers:

1. Manufacturer: Essex Wire Corporation, Chicago Transformer Division
Primary: 117/141/234/282 volts
Secondary: 4800 Volts CT at 475 mA or 5760 Volts CT at 321 mA
Size: 9.7" x 11" x 8.75" H , 102 lbs
Condition: Used, scratchet paint
Asking Pric: $100 plus shipping

Here is what Surplus Sales in Nebraska said about this transformer:
4800 vct - 475 ma
(TP)D3221B
Primary: 117 / 141 / 234 / 282 vac, 50/60 Hz. Secondary: 4800 vct @ 475 ma
or 5760 vct @ 321 ma. We loaded this beauty down to 1 amp on the 4800v
winding with no appreciable voltage drop. Let's just say she is very
conservatively rated. Hermetically sealed. Stud mount at bottom. 9-11/16" by
11" by 8-3/4" high. 102 pounds.
$395 each

2. Manufacturer: Industrial Transforemr Corporation
Model: ITC No. BP-7200 (TF1RX02YY)
Primary: 115/230 Volts
Secondary: 6336 Volts CT at 500 mA
Size: 9" x 10.25" x 8.25" H (without
projections)
9" x 12.5" base, 10" H (including
base flange and Voltage Studs)
Weight: Approximately 105 lbs
Condition: New in factory box, inside wooden shipping
box (approx ship wt. 115 lns)
Asking price: $135 plus shipping

Source record: 130988

Greetings-

I am beginning to put together my first HF station (around a Kenwood TS-520S, thanks Bill!) and I have some questions about components that I will need and how to hook everything together.

I have about a hundred questions that I'd rather not dump onto the net so if someone is interested in elmering me a bit on basic HF station setup please send me email so I can fire away with my questions. I'm sure they are no-brainers for any experienced HF operator but it's all new to me.

Thanks in advance for any help you can give!

>

Depending on the speaker, filters, and general condition, $1000.00 to $1500.00 This is a high serial number receiver so it has all of the Collins factory mods.

The most sought after filter is the 6 khz am filter. There were a number of others including 3khz, 2 khz, 1.5 khz, 800 hz, and 500 hz. There are also a number of different speakers including a lighted one. And of course, the 4 to 1 gear reduction on the tuning knob.

Sounds like you have found a jewel.

: The fringes can be at 100m if you are running an FM25 or somesuch.
: The reason I would hesitate to popularise the VCO is that too many
: hobbyists who haven't got a clue will build terrible drifting
: monstrosity kits and interfere with their neighbour's radios. The
: PLL is quite low cost and gets around a major source of _POSSIBLE_
: interference.

I guess it depends which problem you prefer, PLL/VCO putting out
a comb of regularly spaced (but very stable) sprogs, or a single drifting
output.

Producing a stable free running oscillator as a kit would be a real
challenge. Harking back to the good old days of kits, Heathkit's
transistor VFO's were shipped assembled. As a junior engineer at a major
manufacturer I personally tested many hundreds of VFOs for professional
communication rx's. Despite using the highest quality components we had to
thermal cycle, datalog frequency vs temperature, individually compensate
with a mixture of tempco caps, repeat the process until good, to get
acceptable performance.

Hello,
Looking for a clean 70Cm amplifier-budget will not permit heavy duty, multimode amps. Ideally a used Ramsey kit amp or similar would work. I'm using a Yaesu FT 708R with a 12 element beam...radio only does a liitle over a watt. Would like to find something that does at least 10w. Thanks for your time.

5326. Help Pac Com TNC 220

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-25 00:00:00 UTC
From: delfin@psyconet.com.ar
Message-ID: <6uhabj$2lf$1@nnrp1.dejanews.com>
Source record: 131010

Hello and thanks for read my message and your help
I have a Pac Comm tnc-220 packet controller and problems to work it
I can receive packets ok, but I cannot work on transmission
When I turn on the tnc, the power and DCD leds lights on and the light of DCD
led extinguish after 2 seconds . Here, all is Ok.
When I run de soft on the screen display the message:
A
Pac Comm Tnc - 220 Packet Controller
AX 25 level 2 version 2.0
Features
Personal message system
Release 1.1.6 10/25/88 - 32 K Ram
Checksum $34
Cmd:
Heart character
C (Why these symbols? - I do not
know what means)
Heart character
C
Heart character
C
Heart character

Here, the bell sound long and at the top windows appears "TNC not ready" and
again the bell sound short and the message change to "Disconnected" at top
windows

Then, I can see the packets from others stations on the screen, but when I try
to make a connection, any led glow (except the power led). This means the tnc
do not transmit to the rig.

My tnc is attached to the PC by a serial cable RS 232 as follow:
PC TNC
1-----------1
TXD 2-----------2
RXD 3-----------3
RTS 4---- ------4 I checked all connections are Ok
CTS 5--- -- -----5
DSR 6----- -----6
SG 7-----------7 signal ground
DCD 8-----------8
DTR 20----------20
22----------22

When I check the Rs 232 status display these values:
8250 (MSR register)
Adress: $3e8
DTR - RTS - TERI - DDCD - DSR(6) - RG (22) - DCD (8) : 0 (for all)
CTS (5) : 1

Can you tell me what is happening and what can I do?
Thank you very much in advance for your help

Hello Peter,
The FT7 was the first product in small package by Yaesu on early 80's. It covers 80 to 10 meter band, you need to buy extra crystals for other 10 meter segments. It is rated 20W PEP output but it will produce about 10W. It has many pug in card and the contacts get dirty and make intermittant operation. The front panel often gets faded plastic surface and the top section of the front panel plastic easily get cracked. It is a decent radio if you can get it less than 200 dollars, the repair is impossible due to the lack of parts.It has no provision for CW filter even though the bigger brother, FT7B, 50W output type has Audio cw filter. I think it is about equal to TenTec Argonaut and good for QRP operation. By the way, it is 9 MHZ single super. The VFO drift as usual.

Good luck to you.

But you're talking about receivers where the tuning of the VFO has to
track with the tuning of the RF and mixer stages, complicating things.
This is not a problem with a transmitter.

Re: monstrosity kits above, well that's already happening. The Ramsey
FM-4 was a real problem for me. All the projects on the web sites seem
to be mediocre to poor in that respect.

5333. Antenna tuner for FT-101Z, FT-101ZD

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-25 00:00:00 UTC
From: skoric@uns.ns.ac.YU
Message-ID: <360C201B.31E7B7BC@uns.ns.ac.yu>
Source record: 131017

Hello gentlemen,

I have a couple of 101's in the local school club. There we also have a couple of single band dipoles, that I would try to use on more bands if possible. So, I would appreciate any suggestion regarding an universal antenna tuner, that will match 101's features and various dipoles.

Misko YT7MPB

5334. Hy-Gain TH3 service need

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-25 00:00:00 UTC
From: skoric@uns.ns.ac.YU
Message-ID: <360C22C8.18424B0F@uns.ns.ac.yu>
Source record: 131018

Hello gentlemen,

Here we have in the club Hy-Gain TH3Mk3 beam. It is a bit old one, we are new here and don't know about its features. It measures a short circuit on the other end of the coax line. We checked the coax and replaced what it was needed, but we don't know if beam should measure short circuit or not. Actually, when the inner conductor is connected to

the radio, signal is very strong, but, when the outer conductor is connected - the signal level goes down almost completelly.

Any ideas what to fix there?

Misko YT7MPB

5335. Hy-Gain yagi service need

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-25 00:00:00 UTC
From: skoric@uns.ns.ac.YU
Message-ID: <360C2266.E40F6A9F@uns.ns.ac.yu>
Source record: 131019

Hello gentlemen,

Here in the local school club I have found on the roof a Hy-Gain yagi, about 4m long, having 8 elements. There is no other data about that antenna and I suppose that it is for 2m band (looking at the lenght of elements). Antenna is in satisfactory condition, needs some fixing. I have a question:
A radiating element has 2 connecting points that are connected to the boom via something like the match. There is also another connecting point that is connected directly to the boom. This third connecting point is located between the other two, so, now there are 3 nuts and bolts. I don't know (but I suppose) that maybe some other hardware is missing, i.e. connecting box with a female connector, a kind of balun etc). I want to use that antenna on 2m, with RG-213 cable equipped with PL-259 connectors.

Any suggestions regarding matching details? Is there any Hy-Gain email address covering customers' service?

They haven't gone out of business, but I don't know their website.

I'm having trouble with their MHC777 charger, and I called the 800 number
in it's manual (800 376 9992) and got a **REAL PERSON** on the first try.
After explaining the trouble with my charger, I was forwarded to a
REAL TECHNICIAN who gave me a test procedure (which I won't be able
to try until this weekend).

I was astounded that for a $50 device I received a 800 number for help that
actually worked. The problem with my charger is unresolved, but just the
fact I actually got a person to talk to put Maha near the top of my list
for vendors. Believe me, it's really rare to get 800 number support for
anything, let alone a battery charger.

I have a Viking11 Civil Defence version (which should make it factory wired) for sale, or will consider a good SX62 as part of a trade. This transmitter has been in storage for several years, and was owned by a Civil Defence organization for several years previouis. I was given to understand that it had less than 100 hours of operating time on it. Looking inside, it would appear to be true. Unfortunatly, a large "sticker" was applied to the front of the cabinet just over the Johnson logo on the right side, and the cabinet does have some scratches and paint touch up on it. One would downgrade the cabinet to a 7. The only mod to it was the addition of push to talk. $225.00 plus foam in place packing and shipping. I have a copy of a manual for it.

Are there any other available mic/ear pieces, other than the ones Yaesu
provides?

Premier/ADI offers a GREAT earpiece/boom mike combo just for our FT-50s! It
doesn't squeeze IN your ear like some...it has a hanger that goes around your
ear, and the earphone "sets" against your ear. I have received excellent
transmit audio quality reports.

The SPM-202 can be seen at:

http://adi-radio.com/amateur/microphones/index.html

and is available at Ham Radio Outlets nationally, as well as other quality
dealers.

Ham gear doesn't require type acceptance. That's how they get
all of the Galaxy / Mirage / Connex "10 meter" radios into the
country. The FCC and customs are well aware of these radios and
their "convertibility" for cb use, but can do nothing about it
due to the way the laws are worded. Many ham radios are
submitted for approval, kind of like the good housekeeping seal
of approval. Sean >

I have a good condition Radio Shack HTX-100 10-meter mobile rig for sale. SSB & CW modes, 25 Watts. Takes 12V DC.
Very simple to operate, good for your first HF rig. It was my first HF rig when I upgraded to Tech Plus. Cosmetic condition is about an 8 out of 10. Works perfectly. Made an Argentina contact from Los Angeles a few days ago. Includes stock mic, and manual. I do not have the mobile mount rack.
$125 OBO + shipping.
If you are near Los Angeles, I would love to show you this rig and make a few contacts while you're here.
I am in Canoga Park, CA.
Thank you.

From: eb5agv@my-dejanews.com
Message-ID: <6ug3plrjb1@nnrp1.dejanews.com>
Source record: 131119
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Hello!

As title says, I'm looking for help to repair a non-working YAESU FT-709R UHF walky. It seems to be someway 'special', as it has different crystals than standard models. In the technical manual part list, it is shown as model 'F', but there is no more info that the parts which are different (just crystals and some small items) to the other more common models ('A', 'B', 'C', 'X'). As it has been touched by somebody else, I am not sure of which jumpers I should put in the control unit and the meaning of them. And I don't know the frequency coverage of the unit...

It seems that the Q2005 doubler is not working, as in PIN 2 of Q2006 prescaler, I get just about 208MHz. And it is fixed, regardless of the frequency setting in the keypad.

So, please, could somebody tell me something about that 'F' version?. Is there any FT-709R PARTS UNIT (any model, not just 'F') available?.

Thanks a lot for your help!

Best regards.

5370. Re: Singal lost w/long coax cable vs. signal lost of an indoor antenna??

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-26 00:00:00 UTC
From: STEVEN L UMBACH <N9ROU@prodigy.net>
Message-ID: <6ujrb4$6ddq$1@newssvr04-int.news.prodigy.com>
Source record: 130922
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

Generally always put up an outdoor antenna any time you can. The fact
that you will have the antenna higher and out in the the clear will almost
always outperform an indoor antenna even with cable losses taken into
account unless you have an extremely long cable run (such as 250+ feet
depending on frequency). You also reduce your chances of causing television
interference. You did not say what frequency you are operating on and how
much higher the antenna would be, that information would be helpful. If you
are doing 2 meters and operate mostly repeaters, and can get into the ones
you want then it might not be worth the time to put up the outdoor antenna
in that case. The higher the frequency, the higher your cable losses are. If
you are running two meters then 9913 cable would work well with RG-8 foam
cable as an absolute minimum. You would have about 2.4db loss on 150 foot
run with 9913 and about 3.2db loss with RG-8 foam coax according to the ARRL
Antenna Book. Good luck.

From: Alan Wolke <kc2bog@worldnet.att.net>
Message-ID: <360D7936.5A88@worldnet.att.net>
Source record: 130925

To all,

I just purchased a Kenwood PS-53 power supply to run my TS-680S. I have a question. Is the cooling fan supposed to run all of the time, or does it only come on when the supply heats up? Mine is not running, and I don't know if it just isn't hot enough, or if its malfunctioning. Does anyone have the schematic for this supply?

A copy of your response via email would be greatly appreciated.

What frequency, antenna type, and some other information would be helpful. If 30 MHz or lower, 150 feet is not too bad if you use RG8 or beter maybe even RG 58 would do if the antenna is very much beter.

Even on 440 MHz if you use the 9913 type of coax, if you can gain 20 or more feet and get the antenna in the clear such as on the roof, you would be beter off, especially if you put up a beter antenna.

Hi the PS-53 Fan will run only when it reaches a certain temperature...
and that hardly ever happens... 73 de Jordan...

5379. dual band HT's

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-26 00:00:00 UTC
From: rexstout@uswest.net
Message-ID: <rexstout-2609982242220001@dialupd74.ptld.uswest.net>
Source record: 130931

I'm looking at some dual-band HT's to replace my old Kenwood TH-205, but I'm not sure which one to get...

The Yaesu FT-50 is small, lots of features... But when I was looking at it, it just seemed too complicated... Too many menus, too many multi-function buttons... Or maybe just too much labeling on the keypad?

The Kenwood TH-G71A is VERY nice. Fits in the hand nicely, absolutley wonderful backlight... And looking at it, it's almost TOO simple. On the face, it seems to be a rather boring radio, but a cool looking case and good ergonomics...

Icom... Icom... Oh boy. Where do I start? The W32 is very nice, nice to have to reveivers there and all. But it's big. I suppose that's not really that much of a problem, but the smaller size of the FT-50 and G71 is nice. And what's the deal with those batteries? AES want's $140 for the BP-173!! And it's only 9.6v/650mAh... Batteries for the other rigs are in the $50-65 range. As for the T7A, I don't like it all that much. Picked it up and it wouldn't do a thing! Took me a minute to find what should have been obvious key lock switch... Other than that, I just didn't like it much... Uses the same batteries as the W32, and doesn't have the cool display...

Well, I think that's it... Price is a big factor here, and these seem to be the cheaper ones(all around $300). So, any comments on these radios would be nice, any common problems, strange little quirks, etc...

To Piero,
You know, OM, we are really getting fed up with your problem. We personally feel too sorry for you to complain because maybe you can't help your condition. But you really should seek help, seriously, OM, Good Luck. Roland

To Sid,
Please be patient for remittance until I return to Phoenix in couple weeks and get caught up with items not received COD CASH ONLY, OK? . Yes. you will get your promised 501C TAX CREDIT receipt for the difference you sold me the tubes for and the value you placed on them, OK? The readout tubes are being used to repair older Doppler Radar Units I've donated to Law Enforcement Agencies. Sorry you had to catch the garbage here on the newsgroup but you should have contacted me directly. Sincerely, Roland

>
Well, you're are wrong again, Piero. Just to show you how screwed up you are I'm attaching a copy of my cellular telephone bill among many that get mailed to me every month; you will please note my address. You simply don't understand how our system works here and are really making a fool of yourself. You are a prime example of attempts to misuse your badge and position. It's called abuse of power and you would have been immediately fired here in Arizona if not in your own precinct. Many of my friends, and one special one you'd be very, very surprised who I'm talking about, has personally suggested I not ignore your lies, and inflammatory statements, with my silence but that I respond to your lies. The truth is with the evidence, I could sue you and very easily win, but you don't have any assets to attach. All I could do is screw up your life with some ridiculous judgment I could never collect on. For what, I don't dislike you but instead hope you get better. You might consider that maybe you're burned out on your job, OM.

My friends and acquaintances have suggested I should reimburse you the amount FEDEX would have charged you only. Majority have said I shouldn't reimburse you anything because of your mouth. I feel It is not your fault but instead simply your ignorance of shipping conventions for which you shouldn't be penalized..

Roland

Hello all,
I need whatever info I can get regarding the above. We plan to use the above for our club rpt. The guy who brought it in a flea market inthe states said it came with no manual. We connected it to the rx
and tx units using supplied cables attached to J3 and J5 at the rear of the unit. The interface is a small black box six inches wide, 1 inch tall and 3 inches deep, with green
repeater enable led, red c.o.r. led and yellow setup led. There are only two buttons on the front one is a rpt enable and the other is a labelled "setup". Also there is a dip switch inside the unit. (Do you have any info on these
button and dip switches?) As we'd like to cross link this with another rpt we will
appreciate any info on the pin outs of J1 and J2. Hopefully this will save us from hours of poking around with a scope probe inside the unit. hihi.

Best regards from DU

I listed this item last night, however neglected to mention that it is a
continuous coverage version of this transmitter. Made for Civil Defense,
it operated on amateur bands, and other frequencies as needed.

I have just aquired an Astatic D-104 microphone with a 4-pin connector.
The configuration of the pins is a center pin with the other three
arranged symmetrically around the center pin. It looks like the original
connector.
Does anyone know the pinout of this arrangement?
Thanks in advance,
whagen@inreach.com

Actually, only the 800 Trunked Mostars are Prom programmable. The VHF and UHF are computer programmable, but, in addition to the cable (ribbon type cable) and software, you also have to have a MIB (Mostar Interface Box). Also, depending on the VHF version you have, it is unlikely that it will go into the 2 meter ham band (not really sure but the UHF is from 447 or 449 up only). A MIB looks similar to the normal rib, but is differant, and you must take the radio apart and do some jumper shorts during the read/write portion of the programming. Very crude software as well.

I have just returned my SG-2020 for a refund. The rig was returned to SGC for service only to have it returned to me in the same condition as when it was send. There were a number of problems with the rig, most notibably a really anonying oscillation at 5Mhz,10Mhz,15Mhz, and 20Mhz. On 10Meters the receive frequency would shift depend how close my hand was to the tuning knob.
(and a bunch of other things, I won't go into here, these are just the highlites.)
I just read an ARRL review of the rig. They did not really give a good review.

In general I found the rig to of insufficent quality and peformance for the price.

Source record: 131039

Hi ops !

I have my KAM for abt. 10 years.
I have the software update to vers. 8.0E with ext.board.

It works fine all the years. But now there is a mistake on the vhf port.

when I have the mic connector plugged in in my vhf transceiver (both, kenwood and/or alinco) the transceiver switched the transmitter on after some minutes of standby operation.

there is no modulation on the signal. only the carrier .

the transmission-LED on the KAM is not on ! KAM is still standby...(receiving)

this mistake is only on the vhf port. the hf port is ok !

anyone any ideas ??? I think, there is a mistake on the ptt-switching-circuit in the vhf-port of the kam. But i have no schematic diagram.

please help me.

wish you all a nice weekend.

> Does anyone know the pinout of this arrangement?

Even though there may be a "probable" configuration, your particular
mic really could be anything; there's no way of knowing what's
happened through the years. Those things tend to get re-configured on
both ends of the mic cable as people move from rig to rig.

If you take off the baseplate, you should find a large label with some
schematic information relating to the PTT switch and the mic head
connector on the top of the pole.

Good luck!

5416. 20 Meter Phased Verticals

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-26 00:00:00 UTC
From: Ray Augustine <k8ago@tir.com>
Message-ID: <01bde970$ef619280$60b28cd1@oemcomputer>
Source record: 131053

Can someone with a computer generated Antenna program plot the effective radiation pattern of three phased verticals, in line, with phasing harnesses as follows:

first vert to sec. vert.==90 degrees
sec. vert to third vert.==180 degrees

Also, plot 1st to 2nd==90 deg.
2nd to 3rd==270 deg.

Any help would be appreciated.

Ray, K8AGO

Hi,

My apartment manager will allow me to install an outside antenna.
However, I estimate the run is over 150+ ft. Am I doing this for more
trouble than it's worth?

Question I have is, at what point (coax distance wise) will the signal
lost be equal to the signal lost if I simply leave my antenna by the
Window inside the apartment??

Thanks and 73. Jeannie - leave out the "nospam" when replying by

: Hi,

: My apartment manager will allow me to install an outside antenna.
: However, I estimate the run is over 150+ ft. Am I doing this for more
: trouble than it's worth?

The other replies all give good guidance.
What I did *not* see mentioned -- I'll mention:

One more factor in your decision is what you will *not*
receive when getting your antenna as far up, away, and
in the clear. You won't be receiving your neighbor's
coffee grinders, vacuum cleaners, TV sets, electric
shavers, etc., etc.

There's no aggravation like being into a successful weak signal
QSO when some nearby electric apparatus stands your S-Meter on
its ear!

Either Eds watt meter is off or he is loosing alot in the connectors. Not that he did not see what he reported, but something is wrong. Maybe a bad piece of coax. I don't recall the powers I measured (the forward was around 100 watts), but on 100 feet that I measured with a Bird meter, a 100 watt 200 to 500 MHz power element, and a good 50 ohm dummy load, I had slightly less than 2.8 DB loss at 440 MHz. This was usning the N connectors. I would think it should be somewhat less at 2 meters and only 80 feet.

5445. TS-440S PLL Chip

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-27 00:00:00 UTC
From: Thomas C Sefranek <tcs@cmcorp.com>
Message-ID: <360E862F.809F0A8E@cmcorp.com>
Source record: 130882

Hello,

I've repaired many TS-440s with the corrosive gunk...

This one has me boggled.

No error voltage out of the phase detector chip.
(MN6147)
"KNOWING" it can't be the chip, I have added an external pot to
send an error voltage to test the VCO.
Sure enough, it adjusts the VCO thru the expected tuning range.
(And the level is higher than the manual suggests!)
So I reason the VCO circuits are working.
The voltages feeding the chip are all O.K. Ground is O.K.
(VCC is 4.89 instead of 5 Volts)

So I spent 38 dollars to get a chip.
East Coast Transistors sent me a MN6147C.
I think... In the past A,B,C chips are improvements...
But... the parts list shows IC1,4 MN6147 OR MN6147C
IC 9,18 MN6147

Suggesting that the C part is NOT a replacement in all cases.

The chip is replaced, and it's the same story, NO error voltage.

Any ideas? (I'm fixing this one for free for the CAP and I'm out 4 days

and parts so far.)

we have designed and used vfo's for years and with stabilitys down to 25
khz drift with average parts. down to 10 khz with a little bit of
chopping and changing the orange and black philips caps. (different temp
coefs.)
its amazing how much difference a 6 turn to a five turn can make to
stability with a slightly different cap across it.

>If they have a VCO kit that currently drifts 100 Khz, while PLLs drift 200-500
>Hz, we all know which one is better if you have the extra money.
>
>I feel that the kit manufacturers can easily make , at the same price, with
>very little effort more, VCO kits with much better specs than now.
>

true

>Maybe the reason why they are not bettering their VCO kits is the profit
>angle.

The reason many manufacturers may not sell vfo kits is down to the fact
that no legal station can use vfo PERIOD. so how can you say your
products can be used legally. in a court of law you could argue your
pll's can and probably are being used for legal radio stations, it would
be a little harder to argue the same for VFO units.

the above is certainly one of the reasons we have taken the pll line.

Sorry, I didn't make clear what I was looking for.

I would like to get the instruction set for the programming the VX-1R so that I could develop my own application for loading and retrieving frequencies. I currently have the ADMS-1 software, but I would like to write my own (I'm not supper impressed by this program). It works fine, but I know I can create a better app than this, plus I would make mine a 32-bit app. However, to write my own app. I need to know the necessary instructions for the VX-1R.

From: Jay A <jltmn@ibm.net>
Message-ID: <360ebea3.0@news1.ibm.net>
Source record: 130894

I own the Icom....good radio. The only thing is, it's not all that good a radio on 6 meters as the antenna is not a very good 6 meter one. On the other hand, operation on 2 and 440 is great, the radio is nice and small and I don't regret the purchase one bit. The other I considered and have used is the Kenwood (I believe it's the TH-G79) 2 meter and 440 radio. While it is also a great choice, it's 5 watt battery is considerably bigger than the one for the Icom, thus making the Icom the better choice if you want to keep the rig small (which I do).

I have just two minor complaints about the Icom...receive audio is not great...it's a little scratchy compared to the Kenwood, and while you can create alpha numeric names for channels, you need to do so using the accessory pc software which is very buggy.

I would consider the Yaesu FT-50R. It is a very compact rugged radio
that is made to mil specifications. It performs well on 2m and 440.

Source record: 130901

I have had an amateur radio license for about 5 years now and I have yet

to make my first QSO Anyways, I'm
searching for information about a functional radio with a morse code key

that I could make use of that language (code) that I learned and still
know for no apparent reason. Does anyone have info on where or who
I could see or talk to to get a hold of a workable 'radio station.'
BTW, my call sign is KB1ARY I have a programmable scanner

that was given to me, but it isn't capable of transmitting.
Thanks a lot

The TH-3 will read a short at the connection point of the antenna
because of the beta match (the two pieces of tubing length wise down
the boom). Also, are you running a balun? If so, what type?
The suggested balun in the manual is the Hy-Gain BN-86. However, you
can also wrap 12 turns of RG-8/u on a 6" form to use as an RF choke if
you do not have a balun.

Have you tried measuring the SWR? The signals may have dropped way down
just because they were coming in from the opposite direction the beam
was pointed.

I have a copy of the manual for this beam, so, if you need to verify
any of the assembly data, I would be happy to look up whatever you need.
You can e-mail me at ka4ezy@flinet.com

Deal fell through so available again....

For Sale or Trade:
Absolutely MINT Yaesu Tempo One (FT-200) black-face with matching AC/One power supply/ speaker.
The transceiver looks like it was just pulled out of the box for this first time and works perfect on all bands. It has been well treated and kept covered. Upon closer inspection I noticed that the power supply is in really nice shape but has some scratches in the paint on the top (caused by antenna tuner?), but would be easy to fix as the Tempo gear has a "splatter" finish.
Has all original tubes and original owners manual.
This model has the solid-state balanced modulator circuit. Covers 80-10 meter bands and has never been molested by a CB'er. I will throw in a new matched set of 6JS6C final tubes.
$250 plus shipping or trade for one of these radios:
(must be in good shape and working fine)

Kenwood TS-520, TS-520S or SE
Yaesu FT-101, 101B, 101EX
Heathkit SB-104A + PS

I go to Fry's because that is where I get the best price. I don't go for the service -- if that's what I wanted I'd go to CompUSA and pay retail (and probably still be disappointed). When I go to Fry's I know EXACTLY what I want because I'm not paying for help or expert advise. I'm not paying for generous return policies. I'm not copping a laserjet to print up 4 or 5 thousand flyers, and then returning the printer that next day claiming it doesn't work. Believe it or not a lot of smart-ass GenXers pull those stunts and guess who pays for it -- the customer.

You think the hired help is rude? Be rude back, they're used to it.

I always pay with a credit card. That way when *I* screw up and buy the wrong thing, or I need to return it because it doesn't work, they just issue a credit and I'm done. Or, I pay cash, that way of there is a return, they give me cash back. You gave them a check? What's wrong with them letting it clear before giving you a check back? Don't try paying with a check for totals over $350.00. That really stops the system up. Of course, I don't want to be paying higher prices to cover some deadbeat's bad checks, either. In a way they are protecting me, aren't they?

As for the toner cartridge, why the big whine? You can take the one you already installed and put it in the replacement printer. Leave them the sealed one. Do it at the store and test it so you know it works. Good idea?

You don't get Nordstrum's service at KMart. Stop expecting it. They must be doing something right -- look at all the customers. And the next time you see a price to good to pass up, you'll go for it. Just be prepared for the Fry's Experience.

Cheers,

TR

Yes. About 70% approval last time I noticed. About the same as Nixon's just before his impeachment hearings began. Odd isn't it? Yanks don't care about politics much, but they have an obesession for watching TV. They watch even when they don't like
whats on. When there is nothing else to watch they they will be screaming for his head if for no other reason, than to get his face off their TV. Sometime next Summer probably. Although I consider Clinton to be a BOATANCHOR around the neck of the public this will be my last post on the subject on this NG.

I'm not knocking ADMS-1 too hard, but I know I can improve on the user interface. Plus, I think it would be a great programming exercise. Additionally, I think I would get a better understanding of the features and functionality of my radio. I wish Yaesu would publish their instruction sets/code as other companies do for their products (ie: Garmin-GPS & Winradio).

I have wondered if Yaesu might have an exclusive agreement with RT Systems. Currently, I'm considering who within Yaesu to approach. Do you know of a contact at Yaesu in their research & development/product development lab or similar group by chance?

If I'm able to get something together I'll make sure to include you in a beta test.

Feel free to email mail personally at the address below if you have any ideas or suggestions.

Using a credit card will help some in a situation like this. If they refuse the refund you can have the credit card company yank the money back. If you do get the refund the card is credited and the money is available right away to spend......

I'm no RF engineer, but it seems like the spurs from the PLL could be easily filtered. Is this not the case? How do they make all of the radio gear that uses PLL technology meet the type acceptance standards?

I know what you're saying, but a VCO is just a poor way of making a stable RF frequency reference. I think the quality of the parts required, and the fact that you'll probably have to put the entire oscillator in a temperature controlled "oven" will make it ultimately more expensive than the PLL. I'd prefer an LC circuit if I was going to build a cheap RF oscillator. Look in the ham radio literature. Ham books are a great source of information such as what you want. I don't think you'll find any VCOs being used except inside a feedback loop (a PLL). I'd investigate the LC oscillator angle for a potential cheap RF oscillator source that's simple to understand. Maybe you can find a kit for such a device out there.

I would think that you'd end up spending the same or more money to create an adequately stable VCO as you'd spend on the PLL system. I think that's the main point. If you have a tested, proven technology to create a stable frequency, and it's cheaper to build, then why work so hard to make a different technology do the job? The kit builders probably realize that.

I'm not saying that it absolutely can't be done, I just bet that a good VCO will cost as much as a better PLL.

If you have a good design for a VCO kit that will do a good job and be competitive, there's your niche. You should be selling these kits. If you can make good money, then there's the proof that you're right about the market for such a device.

Good luck with your project in any case. Maybe someone who knows more about all of this than I do will suggest either a good VCO circuit for you, or can point you toward a supplier of such a device.

In any case, have fun with the whole thing. Learning about all of this is a good part of the fun.

Jim H.

I'm not familiar with that antenna, but I have used a Radio Shack scanner antenna on two meters.
Actually, it worked fairly well.
I would suggest that you borrow an swr meter or have someone check the swr before using it for extended transmit.

>Date: 13 Sep 1998 17:17:39 GMT
>From: k1lpi@aol.com (K1LPI)
>Subject: A Constructive Discussion Of The FCC Proposal (LONG)
>

Just a short proposal:

- If we want ham-radio to survive beside the Internet and other incoming, new tech modes of communications, especially up to 30 MHz (HF), let's remove some barriers.

For example, let's offer all prospective hams (either code or no-code) to enter HF bands, say some parts of sub-bands that are supposed to be used in digital modes (HF packet, amtor, pactor, clover, g-tor, etc). Remove Morse exam and some high-tech tests from students, teachers, B.Sc, M.Sc, PhD holders of any technical related science. There are so many young prospective telecom folks that, for sure, would improve the tech level of up-to-date digital and satellite areas, that are not interested in "fundamental" theory questions - that will never use in practise. The same thing is Morse that majority of them will have to learn but never use. Now there is an increasing number of new hams who purchase factory new radios, other equipment and accessories, high speed computers etc. Offer them to join us without too much barriers, and this hobby will survive!

The high tech industry would be interested too. Suppose the manufacturers to produce new types of radios like "digital only radios", dedicated for the new ham generation - radios without those portions of bands that are supposed to be used for CW, contests, "fundamental" modes like blah-blah SSB, without appropriate connectors for key, mic etc. Such radios and their proud owners won't disturb any "fundamental" mode etc etc, but they will improve the hobby and put here the "fresh blood".

10 meter Eagle 2000 fantastic condition, AM, FM, SSB, CW. Also have a D&A Maverick 250 amp that also is in great condition.
Would like to sell them together as they are matched up perfectly but will consider selling alone.

Make me an offer I cant refuse and they are yours. I have had many great QSO`S with it.

Hello, My 30 years of professional and amateur experience is that nothing will beat an antenna high up on the roof. Even with 150 feet of cable. What you lose in the cable, you will gain in higher signal strength. And I'm sure that you could more easily place a better antenna on the roof, then you could "by the window". For cost and cable loss, I would recommend RG6 75 Ohm television cable, regardless of what anyone else tells you. It is the lowest cost cable with the lowest loss for the size. To answer your question, the cable loss is not only determined by the length, but more inportantly by the frequency of the signal being received. And if your antenna is for a scanner or other receiving system, then you could (if you feel the need) add a mast mounted amplifier to eliminate cable losses, but in most cases there will be NO need. Jeannie:

We need to know what frequencies you are interested in, if this is receive only or if you are a licensed Ham desiring to transmit as well (if so, at what power levels). Also, what solid, metallic and/or noise-generating objects lie between your rig and the antenna (the type of cable is effected by this info.)?

The loss through only 150 feet of coax is about meaningless at HF (1.8-30MHz) ... and can be rendered close to zero if you get some often-free coil ends of CATV cable from your local CATV station/installer. Open wire, commercial or homebrew are also extremely low-loss options.

With more information better responses will be possible.

Wouldn't it just be simpler to build a cheap synthesized PLL type unit? I'm guessing that in the long run, most pirate radio stations would be better served by putting out a clean, stable signal that's less likely to annoy people using adjacent channels. If the pirate station doesn't cause any trouble, then the officials will have no reason to waste a lot of time tracking them down and putting them out of business. On the other hand, if the pirate uses a VFO, and it drifts, then the pirate station is begging for the officials to come and shut them down.

Hi,

Anyone have a source for Non-inductive resistors? I am building a T2FD (Tilted Terminated Folded Dipole) antenna. The design calls for a non inductive terminating resistor of 400ohm and about 30W. I'm currently using a bunch of 1/2W carbon resistors in a series/parallel arrangement that get's me about 6 W which is fine for QRP, but I would like to crank up the power every now and again.

According to the specifications, the losses you quote are correct, Steve.
Sometimes, reality is a bit different.

Several years ago I put up a 2-meter antenna with 80 feet of new 9913. Just
out of curiosity, before it went up, I put 100 watts into the bottom end
and measured 50 watts at the top. Readings taken with a Bird wattmeter.
But, I suspect, though haven't confirmed it with measurements, it's still
the best stuff short of hardline, and better than any other conventional
coax cable.

All Electronics Corporation probably has what you want. In their summer 98 cat #498 on page 84 on the upper left side, there is a listing of various power resistors. There is a ceramic resistor rated 400 ohms at 50 watts for $2. They also have axial and sand style resistors which I believe may be wirewound and not good for what you want. Go to their site at: http://www.allcorp.com and order their catalog or download it in .pdf form to look at it now. I have ordered from them myself and they seem to ship very quickly . Lots of other neat stuff in their cat. too. If they don't have what you want, try Goldmine-elect or American Science and Surplus.

Then again, if the resistor just *happens* to be the exact value,
form-factor, and power-rating that you need for an obscure flyback
circuit it might well be worth that $19.95....

VCO drifts, Pirate knows he has drifted, he does something about it

PLL makes spurious signal, Pirate does not know, does nothing

Both have a place. There will always be a low end requirement for
experimenters and beginners.

Weather we like it or not, VCOs will be made by beginners, hobbysits as they
are simples to make/comprehend.

Some in this news group do not want a VCO kit as it cannot reach the levels of
perfection they want. It is not the road to technical nirvana. I agree.

There are already VCO kits out in the market. The technical purists cannot
stop that ? Infact I guess that most hobbyists are lured in by simple VCO
circuits before they migrate to other technologies. It is a great stepping
stone.

But in any endeavour, 20% of the efforts gets you 80% of the desired results.
There is many times no need to kill yourself to get that last very bit of
result as the cost parameter starts rising sharply after that point.

What I am saying is that Kit manufacturers are putting only 10% efforts into
decent design of VCO kits, leading to lousy VCO kits.

If they have a VCO kit that currently drifts 100 Khz, while PLLs drift 200-500
Hz, we all know which one is better if you have the extra money.

I feel that the kit manufacturers can easily make , at the same price, with
very little effort more, VCO kits with much better specs than now.

Maybe the reason why they are not bettering their VCO kits is the profit angle.

With that, my case rests, and thanks for a lively discussion !!!

Source record: 130964

One thing you could do is to use 16, 2 watt, carbon, 390 ohm resistors by putting 4 in parallel to make a 97.5 ohm resistor and then putting four of these parallel combinations in series to arrive at 390 ohms at 32 watts (16 x 2 watts.)

Of course, you might need to derate the resistors some because of their close proximity to so many other resistors! And, I have noted that carbon composition resistors seem to have disappeared from catalogs, etc. Does anyone know the how metal film resistors would perform in this application?

Regards,

Bill

Icom U-400 UHF Mobile

We have 2 mint condition IC-U400 Modern Heavy Duty UHF Mobile Transceivers Dimensions: 6.7 (W), 2.0 (H), 10.2 (D), 5.7 lb 35W output power 5 W audio output (with a 4 ohm load) 440-480 MHz +/- 16 programmable channels Includes Built-in CTCSS Tone Encoder/Decoder Normal scan and priority scan & HM-35 standard hand mic $300.00 each + Shipping

Click Here For A Picture Of The U-400

We also have one HM-37 Heavy duty commercial DTMF mic for these radios, $50 with radio purchase only.

Lastly, we also have one example of the U-400's predecessor avaliable, although it's a bit banged-up, it does work

-Icom IC-435 16 ch. 35W commercial UHF Mobile 453-470 Mhz band w/ CTCSS, mounting bracket, hand Mic. This rig covers 453-470 Mhz. It's field programmable, you don't need any programmer equipment other than a soldering iron and some tools. It's fully PLL controlled, so you don't need to buy xtals. Programming is a bit time consuming, though. There are two diode matrices. One for TX, one for RX. The frequebcy for each, on each channel is decided by installing little diodes in a certain pattern. I'd supply the instructions. The PL encode/decode scheme uses a standard TSU-32 board, so there is 5 solder pads, the tone is decided by which pads are connected, so no matter how many channels you have programmed into the rig, you can only use one tone. No hand microphone $50 + Shipping, or additional shipping cost only if buying a U-400.

Interested Parties, please E-mail to mw@hula.net

I don't have any radio advice for you, just an antenna tip with that model. I have a '96 Taurus (purposely didn't get one with a center console to make it more "radio friendly"). Just so you know, forget about putting a mag-mount on the trunk - it's made of aluminum. Go with either a body mount (get out the big drill) or glass mount (looks sharp on these cars).

Here's what I found on the internet. Proceed with caution.

--

copied from the internet:
From: anderson@optical.bms.COM
Newsgroups: rec.radio.amateur.misc
Subject: Mods for Alinco DJ560 Dual band portable

The following modification to the Alinco DJ-560-T will enable it to xmit
out of band. Rumor: may also enable cross-band repeat.

1. Turn power off.
2. Remove battery.
3. Unscrew stainless steel battery connector plate. This is the
rectangular
s/s plate found at the bottom of the unit and is held in place with
(4)
small chromed, phillips head screws.
4. Remove Antenna.
5. Unscrew the one black head, phillips head screw found immediately
adjacent
to the BNC.
6. Carefully remove the grey DIAL, UHF and VHF plastic knobs.
7. Unscrew the lock ring nuts that are found under each of the three
sets
of knobs.
8. Gently remove the plastic top cover on the unit.
9. Unscrew the (4) black head phillips screws that hold the body halves
together.
10. Place the unit face down on a work surface that is covered with a
towel
or a similar soft cloth. This will protect the unit from being
marred
while you work on it.
11. Gently separate the two body halves about 1/2" to 3/4".
12. Cut the ORANGE wire loop and reseal the exposed ends with heat
shrink
tubing.
(NOTE: if your DJ-560T is serial numbered from #0636-0705, the loop
will

be YELLOW in color! However whichever the color, cut only
the
loop! It will be the only loop to be found!)
13. Reassemble the unit in the reverse order of the above instructions.
14. Reset the CPU by holding the 'F' key (above the PTT key) down and
turning
on the unit.

This mod was supplied by a major amateur radio dealer. Several have
tried it
and it works. One caution: The black screws that hold the back on are
real
cheeeep. Use a screw driver of exactly the right size or you're likely
to
strip the heads.
==========
Note: I haven't tried or verified this, proceed at your own risk!
WA2ISE
And do not transmit outside of legal bands!
/EX

AT THE RISK of seeming to look down my nose, (I apologize in advance)
let me mention that I used to make resistors out of battery carbons.
Those things in Dry Cell Flashlight batteries?

You can get the exact same thing in the quart size, and the resistors
you can make from them ! ! !

If you can't find a big one look for a 6-volt vence charger at a farm strore.
You want the kind with round ends. They should have 4 cells inside.
Weight about 10 lbs. Carbons inside about 4-5 inches long and about
an inch thick. Non-inductive.

Good luck.

Hey Joe. I would go with a Yaesu FT50 or FT51. I have the 51, and it is a great radio. Many of my friends have the 50, and it is also great. I feel that they are built better than the Icom. I also don't think that you really need the 6m. 2m and 440 will probably be good enough.

I bought a time interval analyzer, model 8850, made by International test Instruments, Inc. at the swap met.

I was wondering if anyone has any info on the unit or where the company presently is located. It needs a boot disk to start up and I'm looking for that.

Any help would be greatly appreciated.

I doubt that would do any good. Your receiver should already have a
preselector. All a preselector really does is tune the front end to a
narrow band of freq's, same as the ant tune or preselector in a recvr.
This would not help you with BC on 40. MK

Good luck, as the other poster said, those are kinda low prices for
those rigs. Even the 430 can still bring up to 500 or so. But look
around , you can find deals here and there. Now, I have a Icom 730, that
I see lots of those for sale around 350-375. And they are good rigs. But
usually you will have to pay a bit more for a 430. BTW, my 730,not for
sale.. Good luck.. MK

Welcome to the "Fry's experience". You quickly learn that anything on sale is a discontinued item that they bought by the palette full (including disk drives). These items are discontinued because they are obsolete or because they don't work (or both). Compare the prices of first run, current merchandise at any discount house or computer store with those for the exact same item at Fry's. Fry's is usually the same or 10% higher. The only "deals" at Fry's are on junk.

Every seasoned Fry's shopper knows to first look at the pile of any particular item. If more than 20 percent are returns (as indicated by the "Quality" sticker) then the item is junk. I have witnessed a Fry's employee take an item that I returned, slap a "Quality" sticker one it, shrink wrap it, and place it the restock bin. I informed the Returns manager that the item was defective and he simply shrugged and told me to get my refund and leave.

> It is a great scanner receiving antenna, I'd like to use it on 2 meters.
> The repeaters I'd like to work are coming in full quieting.

An antenna with an SWR of 12:1 can be a great receiving antenna, but if
you send 50 watts to it and 45 come back (putting 95 watts on your 50-watt
final amplifier), your radio might not be happy with the results.

100 feet of wire would probably be a dynamite *receiving* antenna, too.
But your intuition would tell you that it's not going to be a good antenna
for *transmitting*; you might even get good range, but your SWR will be
off by a mile.

If you're talking about doing this with a handheld, it *probably* won't
hurt; they're made for rubber-duck antennas which have high SWRs anyway.
But I wouldn't try it with anything else without measuring the SWR.

5550. Re: Source for resistors

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-28 00:00:00 UTC
From: Tom McDermott <mcdermot@NOSPAM.aud.alcatel.com>
Message-ID: <360FFAC1.753E@NOSPAM.aud.alcatel.com>
Source record: 130755

In general, carbon composition resistors are getting very hard to
obtain.
They have mostly been replaced with metal-film resistors. 1% metal-film
resistors may be trimmed to final resistance by laser-cutting a spiral
etch. This unfortunately makes them slightly inductive. 5% metal-film
resistors are do not require trimming the resistance and thus are usualy
relatively non-inductive.

In terms of overall performance, metal-film resistors generally
out-perform
carbon composition resistors in all areas except repetitive, high
peak-power
handling. Very few application exercise this mode of the resistor. One
mode
that does are snubbers in switching power supplies.

You should find that 5% metal-film resistors are perfectly suitable for
use
as a dummy load in the HF range (and VHF range if good construction
techniques
are used).

>Yeah, but why should anyone have to pay for the "best price" with rude,
>incompetent salespeople and store policies that seem to assume everyone
that
>shops there is a crook?

That's how they keep the prices down. Cheap labor and extensive control over payments. If they treat you like a crook, don't take it personally. It's just another way to keep the prices down. If they hire comptetent help, and loosen up on their policies it results in -- you guessed it -- higher prices.

>You shouldn't be penalized if you pay with a check, no matter how large the
>total

You aren't penalized, the prices are the same. For a large check, they don't want to get burned and have to pass the loss off as -- you guessed it -- higher prices.

>Fry's doesn't seem to have heard of on-line check verification.

They have heard of it, they just don't want to pay for it (it ain't free) because paying for it would result in -- you guessed it -- higher prices.

>Calling the bank to verify checks went out of most stores' practice years
ago.
>Fry's policies and procedures are the most inane and most
>customer-unfriendly of any major store in the US.

They sure have low prices, though, don't they? They could fix all that for you but it would result in -- you guessed it -- higher prices. They don't need to do it for me because I like -- you guessed it -- lower prices.

>Just why, also, do they insist on subjecting you to an inspection as you
leave
>the store? Again, assuming everyone's dishonest is the only reason that
makes

Hi

I have been asked by a visually impared ham for help hooking up
his Talking Digital Dial. Trouble is, I know nothing about it, and
info for it is very limited. Is there anybody out there that can give
us some advice ? It's a TDD-2B, and he wants to connect it to
a Heathkit HW-12 (?) single band transceiver.

I am wondering about power levels that the thing can tolerate
as well as where the heck would one pick off the necessary
frequency and power level to make the thing work. I understand
that it was hooked up and working on an FT-77, but it had a
plug on the back to accomodate this unit.

Any help would sure be appreciated.

Regards
Reed

Had a similar experience with them recently myself. Bought a scanner (good price!) but had to send in a "rebate" form. The one in the package was unreadable. When I called to get the address to send the form to, I ran into a brick wall. One guy actually told me after they have their $$$'s any problem is the customers problem!

Finally got the info, but it probably cost me $12 or so in phone calls.... My "good price" wasn't so good after all. At least the scanner works!

But their policies sometimes make it Fun to shop at Frys!

I once saw one of their computor department employees go into a "Full lockup condition" and almost melt down on the spot. I didn't realize that this employee was already doing something for another customer. I asked him if he could find something for me. He stopped... looked at me... opened his mouth and moved it a little (no sounds came out)... he then turned and looked at a woman nearby, still moving his mouth (and still no sounds coming out). He then proceeded to look at me then her then me etc. All the while moving his mouth with no sounds coming out. After a little bit (quite a bit actually) I realized he must be 'helping' her so I said. "If you are already helping someone else, nevermind, I will get someone else to help me." At that point he looked very relieved and went on his way to presumably help her. I'm not sure how long he would have stood there if I hadn't said anything, but I think he would still be there now. You could almost see him melting down, completely unable to resolve the issue, probably thinking, "I'm helping her, He wants help, may boss said to help everyone, what do I do" (repeat endlessly).

I still laugh pretty hard any time I think about it. I've never seen a person look that confused. Thanks for reminding me.

By the way, I agree with several of the responces I've read. Frys is great as long as you know what to expect and you don't take things personally. And don't let them give you any cr*p when you return things. They'll take it back and just put it back on the shelf. (For that reason you should always check to see if what you are buying looks like it may have been repackaged.)

5561. Dual band mobiles - Yaesu or Icom? Or Kenwood?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-28 00:00:00 UTC
From: "Brien P. Crotty" <Brien.P.Crotty.1@nd.edu>
Message-ID: <36100D9A.B76FE4A@nd.edu>
Source record: 130766

Hello all,

I have been using a Yaesu FT51RHP for the past week or so, and love it. I am now in the market for a good dual band mobile with the same features (I want to try out the paging feature of the FT51). I am considering the following:

Yaesu FT-8100R
Icom IC 2710
Icom IC 706 MkII

Can anyone provide any information regarding any of these? I definately want to be able to set up the mobile as a repeater, and would like simultaneous operation (VV, UU, VU).

Does Kenwood have an equivalent product that might be better?

Thanks in advance for the help,

Brien

5562. Opinions re HT 2m/scanner

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-28 00:00:00 UTC
From: axlotl@cyberpass.net
Message-ID: <6uovmn$7ll$1@news.infonex.net>
Source record: 130767

I've recently become interested in RF/radio, and am planning to purchase a handheld HT/scanner combo. I've been reading about the Yaesu VX-1R, Icom Q7A, Icom T8A, Kenwood TH-G71A, and the Alinco AT-600.

I anticipate that I'll want to use the radio for -

Experimenting with packet/digital radio modes
Communicating in an emergency (earthquake/Y2K/??)
Scanning for interesting transmissions (ideally with a PC interface)

One distinction between the units above is in transmit power - the Yaesu and the Q7A are both <= .5 watt, the others are <= 5 watts. How important is this? I'm in a relatively populated urban area - does that mean I'll need more watts to get through buildings/obstructions, or that power isn't so important as it'll be easy to hit repeaters, or ..? My hunch is that more power available is probably better, but am curious if the extra $100-150 it seems to add to the radio's price is going to be realized in correspondingly greater happiness/utility. I'm initially biased towards the units which include a keypad (especially if they'll generate DTMF) .. how important is that if I don't anticipate using the "phone patch" side of repeaters?

I'd appreciate any insight people have into the features of one or more of the radios I mentioned - or perhaps models/manufacturers I've overlooked. Am planning to take the Technician exam next weekend, so I'll be legal when I get the radio.

jsm@mindspring.com writes:
>The ads have sure fascinated me, and I have just one question you may
>be able to answer. I can imagine how different packs could be
>accommodated electrically, but how are the physical connections made
>to line up on a "universal" charger?

The charger has two "pin blocks" near its left end. There is also
a latch on the front of the charger that lets you open and swing
the entire left end of the charger (about 20% of its length) back
out of the way. This "left end" is really a mechanical clamp for
the pin blocks.

When you've opened up the clamp, the pin blocks are free to move
closer together or farther apart, as well as up and down. You take
the battery pack and place it on the top of the charger, where it is
held in place by a large magnet. You push the pack against a plastic
rail, which provides an alignment edge. Then you adjust the two
pin blocks so the contacts mounted on the blocks are lined up with
the charging contacts on the pack.

The pin blocks have contacts both on their top and right side, so
you can make them line up with battery packs that have contacts on
either the end or the face. There is also a polarity reversing
switch, so either pin block can be positive. Once you've done
all the adjustments to make the charger's pins match the contacts
on your pack, you close the clamp (the left end of the charger) again.
This clamps the pin blocks against some rubber, preventing them from
moving any more.

At this point, you just put a battery pack on the charger, slide it
until it makes contact with the pins, the charger beeps to tell you it
saw the pack, and it begins charging.

So if you have only *one* shape of pack to charge, you set up the
pin blocks once and leave it. The MAHA charger isn't *quite* as
convenient as a drop-in fast charger, but not much worse. However,
if you have a bunch of different packs with different charging contact
configurations, you can spend your life readjusting the pins to make
contact with each pack.

There is another choice, though. The charger has a 2-pin Molex connector
on the other end which is designed for charging radio-controlled model
car battery packs. The connector is sometimes called a "Tamiya connector"
after the maker of those cars. If you have an HT with the charging contacts
on the bottom, you can build your own "drop in" charging cup using brass
screws or something similar to contact the battery charging contacts.

Then wire this to a cable with the Molex connector on the end, and plug into into the MAHA charger. This is more difficult if the charging contacts are on the back, though.

In summary: a "drop in" charger, which uses cups customized for the particular device being charged, is the most convenient. In some cases, the manufacturer provides interchangeable cups, so more than one sort of radio/battery can be charged (e.g. Yaesu's NC-50 charger).

The MAHA "universal" charger is less convenient, but still works pretty well if you can set up the pins and leave them in one configuration. It's quite a bit more of a pain if you have to change the pins every time you go to charge something.

Could have been a bad piece. I have heard of one reseller coiling it up tight and the 9913 stuff does not like tight turns or bends. I was listing to a couple of hams talk that have been mainly into weak signal work for many years and one of them was telling that he would never get any coax from one supplier as it was coiled up very tight and his loss was even more than you measured. Think I would have done more checking before putting that coax in service.

Yes, they are rude and the management don't care about it because they hire lowest paid employee! Ask rude guy how much he makes, you will be surprised. Most of them make near minimum wage. I have been to many stores but the worst one is the Palo Alto store. One time I waited 30 minutes to get the refund and I complained, I asked the manager, instead they sent a security guard and threatened me whether I will get the refund or thrown out from the store. Bad,rude people,it is almost like Bill Clinton, you don't lik it but many people keep going there.

They're very different radios.

The FT-8500 is a former top-of-the-line radio that has recently been dropped in price by a couple hundred dollars. It will do just about anything. It has two complete receivers, so it will receive one VHF and one UHF station simultaneously (or two VHF, or two UHF, with some loss of sensitivity on the "wrong" side). It will do cross-band repeat. It has simultaneous frequency and alpanumeric display of memory channels. It can do DTMF paging and CTCSS encode/decode, though it needs (expensive) add-on circuit boards for some of these functions. It has a "spectrum analyzer" display mode. The faceplate can be removed and mounted remotely using an (expensive) accessory cable. It has almost no controls on the front panel - essentially everything is controlled from the mic. Some people love this, some hate it. There are two different designs of mic. One has a dozen different controls arrayed over its surface; the other looks much like a conventional DTMF mic.

In comparison, the IC-207H is a much simpler radio. It has only one full receiver, so it can receive or transmit on only one frequency at a time - but it has two VCOs and two power amplifiers, so it can do this in either band. No crossband repeat. No alphanumeric display. It has CTCSS encode/decode built in; no DTMF paging is possible. It also has a removable faceplate, which is smaller than the 8500's or just about any other mobile rig - this may make it easier to mount in small cars. The faceplate separation cable is cheaper than Yaesu's too. The 207's mic *can* control almost all of the transceiver functions if you want, so you don't need to be able to reach the faceplate - just like the 8500. But there are *also* controls on the faceplate - so you can use it like a conventional radio if that's what you prefer - unlike the 8500.

Basically, the 207H is designed as a simple mobile that has pretty much everything you need to talk and listen already built in, for a relatively low price because of the single-receiver design. The FT-8500 is a full-blown dual-band radio containing two complete

transceivers in a single box, and lots of bells and whistles. It will do more, but it will take you longer to learn.

You might want to take a look at the IC-2710. It is Icom's dual-receiver equivalent to the FT-8500, more or less. Not that you'd want to spend the extra money for the 2710, but the differences between the 207 and 2710 are the differences between single-receiver and dual-receiver design philosophy.

I can't tell you about relative performace - I don't own either. But I've been looking at both - these are my top two candidates for a radio for use in my car.

Dave

Source record: 130828
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

TriEx H470 70' tower for sale.

This is a 4 section guyed tower,
including guy wires, turnbuckles,
equalizer plates, rotor plate
(drilled for Yaesu and HAM-M)
owner's manual, etc. The tower
recently lost a guy anchor and
was pulled over by the other guywires.
It is now telescoped to about 20', and
is ready for pickup in the Kansas City
area. It weighs around 500#.
The tower needs a new base plate, and
the bottom section legs need to be sleeved
about 3' up from the base. Other than this
the tower is in good shape and was recently
painted. If you can weld, this tower can
easily be salvaged (I don't have welding
equipment or skills). $250, pickup only.

5592. How to get 9.6vdc from +12 (at least 5A...)

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-28 00:00:00 UTC
From: N8OUZ - Joseph <jrerlewe@mtu.edu>
Message-ID: <6umolk$jl3$1@campus1.mtu.edu>
Source record: 130830

Howdy---
I have a Kenwood HT (TR-2400) that will ONLY work correctly when you use 9.6Vdc... 12v or the "operating base" voltage into the radio makes it powered up but the processor does not work correctly. SO, unless anyone knows specifically what I can replace in this radio to make it work correctly, my main intention is to put some sort of 9.6vdc supply inside so that a 12vdc input will give me a 9.6vdc output with enough power to operate the radio at full power--- I'm guessing not more than 5A. Any quick, dirty, and small-packaged solutions to the problem at hand? I was thinking a transformer of some sort... but??

Thanks,
joe

I have an old MFJ VHF converter I am looking to get rid of.

This thing plugs on a 2m HT and allows it to receive from 154-164 MHz.
Obviously, with most of the newer radios, this isn't much use anymore,
but I will sell it cheap if some one has an old radio they could use
it on.

Send me email...

> them the same as putting it on the RG-58?

I know that quite a few people will disagree with me, but here it goes anyway. Having worked in the field of two way radio for 40 years, as well as with satellite television since 1978, I am familiar with both types of cable. Since I always have had lots more RG59 and RG6 cable (both 75 Ohms impedance) on hand then RG58 and RG8 (both 50 Ohms impedance)I always took the easy way out and used the 75 Ohm cable. By now, my whole antenna farm is wired with RG6, from longwave antenna's to microwave. From receiving to transmitting ! And even ALL of my hamradio antenna's are wired with RG6 as well, 2 meters, 70 cm, everything. Since I only use the proper F connectors on this cable, I buy the little adaptors from F connector to PL259(Amphenol)or BNC and use those to convert and give me the right connections. But I do use GOOD connectors, crimp them well and tighten the adaptors well to make sure that there are NO loose connections anywhere. An added benefit is, that RG6 is 100 percent (foil) shielded, where most 50 Ohm cables are only 65% to 95% shielded. My SWR is good on all frequencies and I know from experience that my antenna's work well. RG6 is plentiful & dirt cheap, the connectors are a dime a piece and now-a-days everything in the (retail) stores is made for RG6 cable. Now sit back, relax and watch all of the comments WHY what I suggest is wrong !

But hey, my 82 year old father still believes that BETA VCR's are the better choice for quality.

Wow, Gaza...I am not a programmer by any means...but I sure enjoy the ADMS-1 programming software for my FT-50 and VX-1R HTs...I cannot think of many more options needed to efficiently program these Yaesu units. And whether or not a newer app is 32-bit kinda seems like overkill to me - but, again, I am NOT a programmer.

Sorry I cannot help. You might want to formally write Yaesu with a proposal. Let them know your programming experience, where you see possible improvements, and see what happens. You may be walking into a situation, though, where RT Systems has a "lock" on this type of commercial software for the Yaesu units. I do not know.

Best of luck with your project. If you'd like a "end-user's review" of a Beta release, I would like to be included. And if you need a "Beta tester" contract to protect yourself, let me know. I have prepared them for other projects over the years.

I find that Fry's return policy is pretty good. Always used a credit card.
I don't get too much grief when returning something, just say "it doesn't
work", and they toss it in a reject bin (and probably destined back to the
sales floor! (I never buy "customer return, full warrenty guarentee" stuff)).
They claim they test this stuff, but I doubt they go to that much trouble.

Fry's: The store everyone hates, but always they shop there anyway.....

<snip>

Yeah, but why should anyone have to pay for the "best price" with rude,
incompetent salespeople and store policies that seem to assume everyone that
shops there is a crook?

You shouldn't be penalized if you pay with a check, no matter how large the
total -- Fry's doesn't seem to have heard of on-line check verification.
Calling the bank to verify checks went out of most stores' practice years ago.
Fry's policies and procedures are the most inane and most
customer-unfriendly of any major store in the US.

Just why, also, do they insist on subjecting you to an inspection as you leave
the store? Again, assuming everyone's dishonest is the only reason that makes
sense.

Low prices don't have to be 'paid for' in this way -- as Sam Walton would've
been able to demonstrate. I recently moved out of the SF Bay Area and Fry's
is *not* one of the things I miss.

5614. TS940 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-28 00:00:00 UTC
From: Paul Larson <plarson@xmission.com>
Message-ID: <6und3r$g8n$1@news.xmission.com>
Source record: 130852

I am a new owner of a used TS940. I have noticed that the Alpha Numeric Display on the front panel has no illumination, making it very difficult to read! Is this display back-lit by incandescent means, or is there an electro-luminescent panel behind it? Is it repairable or does one have to replace the entire Display module?

Thanks,

Paul

Please look at Linux-based programming software at

ftp://ftp.funet.fi/pub/ham/unix/Linux/rigctrl/yaesu-0.2alpha.tgz

It contains both protocol and data descriptions for VX-1R programming.
The source code for the tools is also included.

Not from experience, but I've been looking for a solution to this
problem, as well. I've had a hard time finding carbon composition
resistors in high power ratings.

From what I understand, metal film resistors are made by sputtering
layers of metals and other materials onto a ceramic substrate.

I am leaning toward metal oxide resistors, as they are readily
available in 2W ratings, lots of values, cheap, and are non-inductive.

Hi there :)
I'm an electronic musician seriously searching for old SYNTHESIZERS,

KEYBOARDS, drum machines, analog sequencers, vocoders, unusual old

effects and all related electronic musical equipment (MIDI and pre-MIDI).

In general, I'm looking for working or non-working instruments made in the

late 60's, 70's and early to mid 80's. Machines with KNOBS, SLIDERS and

especially ~PATCHCABLES~:

The more unusual, the better.

KB6LUE ... Hello
Where are you located?
Are you guaranteeing this amp?
Do you have the origional shipping cartons?
Are you providing the origional paperwork and sales receipts?
How much warrantry remains on the amp?
What was your origional purchase date?
Explain what you mean when you say good condition.
Are you guaranteeing the amp to be 100% free of any defective problems?
What is the present out-put of the amp with 10 watts of drive?
Do you have any objections to a Mirage service tec inspecting this amp.
Upon Mirages open inspection should they find any problems do you agree to pay
for the inspection and any labor and parts bills.
Should there be no problems then i would pay all cost.
This would be like a clearing house to protect the two of us from fraud.
Personally i don't want someone elses problems and i sure as hell don't want a
pig-in-a-sack and can't-get-my-money-back. And you would not want me hunting you
down to kill you because you had sold me a bill of worthless or defective goods.

Thanks and looking to hear from you soon, and possibly doing business with you.

My wife and I both (at different times) built our first CW receivers.
She from a kit, and I from plans and an old car radio.
You can do the same.
I recently got from the NG a plan for a 1-tube CW transmitter.
You will find it more fun, I think.
Also, I recommend you get 50 CW qso's done before you use a
microphone. then yuo will recognize more information in voice
transmissions than you believed could exist.

good luck.

>thinking a transformer of some sort... but??

If your "12 volt" supply is typical, it is really 13.8 volts. To drop that to
9.6 volts economically, you can take advantage of the fact that the
forward drop of a silicon diode is about 0.6 volts. So a string of 7
diodes in series will drop the 13.8 volts to 9.6 volts.

It is also unlikely that your HT requires 5 amperes. It is more likely
that the maximum current draw is about 2 amperes on the radio's
high power setting. So diodes with a 3 ampere rating should be
adequate. Each diode will dissipate less than 1.2 watts, so heat
sinking should not be required unless you transmit for extended
periods.

Now you could also use a 3 terminal adjustable regulator chip
for this job, but it would have to dissipate over 10 watts and would
definitely need a heatsink. Regulation would be better, of course,
but if your 13.8 volt supply is already well regulated, the diode
string will suffice.

5633. Use mobile scanner antenna for 2-Meter Xmit?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-28 00:00:00 UTC
From: eskin@cts.com
Message-ID: <eskin-2809980751490001@news3.cts.com>
Source record: 130871
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I'm trying to figure out if I can safely use my mobile scanner antenna for transmitting on 2 meters.

The antenna is manufactured by "Everhardt Antenna" and is marked "Tiger". The black fibreglass mast is approximately 2 feet long, with two loading coils which appear to be part of a continuous single wire wrap under the rubber coating.

It is a great scanner receiving antenna, I'd like to use it on 2 meters. The repeaters I'd like to work are coming in full quieting.

Anyone used this antenna as a transmitting antenna for 2 meters or 440?

Thanks,

Michael

5637. FAQ: Plectron and Motorola Alert Monitor Receivers

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-29 00:00:00 UTC
From: parnass@bell-labs.com
Message-ID: <6urp6k$prj@ssbunews.ih.lucent.com>
Source record: 130625
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment,rec.radio.info

Last changed: May 27, 1998

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150

148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder

on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Minimum Volume Setting

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760

email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Hi all,

I have done all the reading I can find, and the direction is the FT1000MP for a rig selection. Do you love the thing or not...your opinions are desired.....I would say that all you folks would know more than I at this point, I have not operated an HF rig since about 84, so I could use a little direction.

Thanks you very much for your time.

Mike - KM0T

The microphone gain on my IC-Q7A was uncomfortably high so I returned it to Icom for repair. I like to talk about 4 to 6 inches from my HTs. My Q7A had to be held 12 inches away to avoid overloading.

I wondered if anyone else experienced the same problem?

My experience over the years with Icom HT's and mics is that
they ALWAYS have way too much mic gain.. It seems as if they
were designed for use in a quiet room at a distance of 20 feet..

Anyway, I always like to "close talk" my mics, so have always
had to put a series resistor in the mic circuit to lower the
gain.. Always worked well and sounded great..

Just my 2 cents..

Mike, I have compared many of the great newer rigs side by side, including the TS 850, The IC 775, IC 756, Ft1000D and the FT1000MP. In my opinion, the Ft1000MP is the best rig for the money value considering operational features and receiver performance. I originally bought a TS 850 and after several years wanted to upgrade to a rig with dual receive (important for dx pileups and contesting...my primary interests), and a rig that had DSP. Comparing them side by side, to my ears, the 1000MP was the most sensitive and had the best blocking dynamic range. The DSP is very versatile in most situations. The MP outperformed them all, with one exception. Believe it or not, the older TS 850 is slightly more sensitive than any of them and has the best blocking dynamic range. This is to my ears, as well as according to the QST rig comparison statistics. Of course the TS 850 does not have dual receive nor DSP, but its basic receiver performance is superior. So what did I do? I kept the TS 850 as my backup and bought the MP! Get either radio and you will most definately be happy. The 850s are running about $1000 in the used classifieds. A new MP is about $2800. Best 73. John, K7JY.

>Well Clint...I thought an agreement is when "two parties" have a mutual
>understanding??? What Fry's is doing is trying to force their policy on
>the public. There is no agreement, no contract.

And none is needed for a company policy to exist. All that is needed for
said policies to be legally enforcible is that they are published and
readily available to the public upon request.

>Infact Fry's hides their policy on the back of the receipts so you don't
see it until >you have paid for the item.

And also posts it via signage at each register and on the back wall behind
the checkout area. They will even advise you of their policy verbally, if
you bother to inquire.

>"you" may choose to allow Fry's to dictate their policy to you.... That's
ignorance!

Every business establishes their own policies and procedures of operation.
Even retail operations. They cannot "dictate" anything to the customer, only
inform them. Ultimately it is the customer who decides whether or not they
wish to do business with the company. All companies know their published
policies very well. If the customer chooses to ignore them, who then is the
ignorant one ?

Personally, I have no use for Fryes. Most of what the various posts state
regarding their business practices and personnel are true. *But* they are up
front about it, and it is common knowledge that it is "Let the buyer beware"
when dealing with them.

Posted for Jim -- REPLY TO JIM -- marijimc@juno.com

For Sale: Heath stuff.

1. SB-300/SB-401 with SBA-300-3 and SBA-300-4 2m and 6m convertors, manuals on all, $350 if picked up in Fordland, MO or $400 if shipped.
2. SB-104, SB-104A, SB-614 Monitor, SB-644 VFO, manuals on all, $500 if picked up in Fordland, MO, $550 if shipped.

Other items he may be willing to sell, should interest be expressed, include a Yaesu FT-707, Icom IC-720, Kenwood TS-520S (as new), and Heath SB-102. (Jim buys and refurbishes these rigs for fun, so you will be getting a reliable rig for very reasonable money.) Some of these look like they just came out of the factory box and others are used - just not abused!

Hi;
Mr. Geter claimed to issue "personal purchase order numbers" and that packages should be sent "COD-cash only". His memory errs because he did not specify either of those conditions at the time that I sent him the RCA numerical indicator tubes.
As far as I'm concerned, I've been ripped off to the tune of a big $25.00 and that's the end of it. Son cosas de la vida.

I'd suggest that they forget about amateur radio if they aren't going to operate extensively. Amateur radio really isn't a good resource unless you use it enough to retain competent radio skills and radio "situation awareness". There are no dedicated emergency channels in amateur radio. You have to know moment by moment what stations and areas you can reach. That requires a fairly high level of activity on your part.

Imarsat satellite phones are available now, for about $1,500. That's a little steep, but you have to ask yourself how much your life is worth. With the Iridium constellation coming on line, satellite phone prices should drop sharply in the near future, so you will be able to value your less highly and still justify buying one.

If it were me, even given my extensive amateur radio experience, I'd still go with a satellite phone if I were going into the back country. That'll offer a lot more reliable way
to call for help if an emergency arises than depending on making a random contact via amateur radio.

5665. FS: Murch Antenna Tuner (full power)

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-29 00:00:00 UTC
From: w7ycn@aol.com
Message-ID: <19980929124553.21683.00003607@ng71.aol.com>
Source record: 130681

Hi and thanks for reading.

This is a full legal power antenna tuner, model # UT-160M. It has a switch allowing the tuner to be switched in or out, routed to a dummy load, or switching the antenna to ground. Also has relative output meter. Very well built with heavy duty components. A few minor scratches on cabinet, but none on face. Comes with original owner's manual. $100 plus shipping from Olympia, WA. Call (360) 432-1114 or leave message.

Pat (W7YCN)

5667. Milliwatt RF Power Meter

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-29 00:00:00 UTC
From: bill-mbi.weiss@sympatico.ca
Message-ID: <6ura0ipjl1@nnrp1.dejanews.com>
Source record: 130683

Hello, I am building a very low rf output transmitter for short distance use (50 meters max). We are sending data from sensors on patients to small receiver that logs data such as temp, pulse rate, accelerometer info (2-axis). The RF power is in the fraction of a milliwatt (.25-.75 milliwatts). Can anyone recommend an inexpensive (less than $500) digital rf power and frequency meter? Optoelectronics tek-toyzs can only measure in the milliwatt range. Fractions are too low for these great tools. Thanks, Bill Weiss

>Thank you very much for the detail descriptions. Sounds like I should
>be looking at the Icom 2710 instead. However, the 2710 cost a lot
>more than than the Yaesu 8500 does it not?

The 2710 is much more expensive. I suggested comparing the 207 and
the 2710 to give you an idea of the "pure" difference between a
single-receive and a dual-receive dual-band radio while keeping
the manufacturer the same for simplicity. Comparing the 207 to the
FT-8500, you are seeing differences between single-receive and
dual-receive mixed in with differences between Icom and Yaesu design
philosophies.

>Which one are you getting?

I'm probably not getting either until finances improve somewhat.

I haven't decided between them. The 207 is cheaper once you buy the
faceplate separation cable, and the smaller faceplate will help
mounting in my Honda Civic. And one band at a time is fine for
actually talking in the car (I have a FT-50 which is single-receive,
and I don't mind that).

The one real significant advantage of the 8500, for me, is that it
does crossband repeat. This isn't useful sitting in the car, but
it *is* useful if you are operating on foot somewhere near your
car and need more power than the handheld provides to get a good
signal into a repeater somewhere. You set up the handheld to
transmit at very low power on UHF and have the car retransmit
that on VHF (or reverse the two bands if the repeater is on UHF).
You might well be able to use only 5 W in the car, into the roof-mounted
antenna that is much more efficient than the HT antenna.

I have also heard people say that the 8500 is more intermod resistant,
but I haven't any direct experience with that myself.

Dave

Hi

Name here is Doug VA3DMB

I am looking for any information (schematics) on a Motorola Pager to convert
to 2 meter Simplex. The pager was on 166.680 and has a clip in vibrator.
The numbers on the outside of the case are

A03FAB4568AA TYPE FAHA NO 109011077
166.6800 MHZ MOTOROLA INC.
616BNG1063

Inside on a label on the PC board is

Korea 8820 NRD6855AN 1 TD289

And printed on the PC Board is the number 6855

I came across this pager quite cheap and thought it would be fun to try and
convert it to 2 meters for local use in ower small town. Any information
you could provide would be appraised

Thanks again Doug VA3DMB

Not canoeing or camping, but I have many times used ham radio in the field,
when I worked in the oil industry in Kansas ans Oklahoma and Nebraska.
>
>Their major concern is to have a way of reporting an emergency. They have

I researched for an article about radio including ELT (emer loc) and was told
that the usual thing, because of so many false alarms, is to see if the beep
continues 2 days. This was beaucoup years ago.
>
>They are not particularly interested in having regular communications while

It will come. they may want it for emergency use only, but soon or late, they
will get bored, want to assure family, and there you go.
>

A ham in Florida in the late 60s and a CB station 3-4 years later, both had
occasion when they received a call from someone VERY far away, and
called a number collect.

The ham called the Coast Guard about a boat in the Bahamas IIRC, and
the CB station called someone in Minn and said tell So-and-so that I am
stuck in a snow drift. It was very hot that day, and the CB station had
a hard time believing the request. They made the call, though.

You might want to think about a bite-size beam that can be mounted on the antenna fitting of a HT, and pointed at a satellite. Make all the difs in the world.

Also, look up the Tuns-Tin transmitters, for light HF. Sorry, I think they are CW if that is a prob.

Good luck.

I agree on the FT-50R. Just bought one this weekend, it's loaded (make sure you get one with the 41 battery pack and new keypad) and really really nice. Doesn't even require you buy a decent antenna to use, the one that comes with it works much better than many stockers.

I was under the impression that when using 75 Ohms cable, you need to
cut it to a multiple of a wave length so that your transmitter "sees"
the 50 Ohms load (antenna) at the other end of the coax.

Since I do not know many people who uas only 1 frequency on any given
band, how do I calculate how long a coax I need ?

Let say I want to use RG-6 for my 2 meter and 70 cm FM antennas (no SSB
fo me yet). I presently need a 65 feet length of RG-8 coax. Do I use the
same length or should I use a multiple of a wave length ? What frequency
should I use in my calculations (if calculations are needed) ?

Stay safe !

Gary:
I beg to differ. In our area (Western Washington) we use the "VHF Wilderness Protocol" for emergencies. It calls for transmitting (or at least starting) emergency messages on 146.520 (the National Simplex Calling Frequency) during the first 10 minutes of the hour at 7 am, 10 am, 1 PM, 4 PM, and 7 PM. It might not do too much good, however, as in a river, one is low to the ground, and for best Tx/Rx you need elevation. Whether or not VHF would work is really a judgement call based on the situation.

5684. Loss of RX with Icom T7A

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-29 00:00:00 UTC
From: "Chad Johnston, KI8CU" <webmaster@nuwaysupply.com>
Message-ID: <6ure3n$nl3$1@newsserv.freeway.net>
Source record: 130700
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I was wondering if anyone has experienced the same phenomenon with their T7A?

The radio is rarely used; it's my wife's. The other day I woke up and grabbed it to listen to NOAA weather report. I tuned into the local NOAA weather radio frequency, and listened for a while. After about 4 minutes or so, the S-meter started jumping erratically, and the receive became so broken, and then the receive almost completely dropped off.

I went to the scanner in the living room, and the NOAA weather transmitter was transmitting fine, as usual. I grabbed my Z1A, which gets used A LOT, and that same freq was fine on that radio.

Any ideas? The battery in the T7A was fine, and I even tried a fresh one, but it made no difference. I hooked the T7A up to my external antenna, and the same thing occurred.

Any advice is more than welcome. Please email me directly, as I don't get a chance to jump on the NG all that often.

Thanks and 73,

Chad Johnston, KI8CU

Too bad Roland, it appears you are the only one who is getting fed up with this problem YOU created...you should have gone to the Federal Express Depot when they called you and told you about the package.

> We

"We"? You have a mouse in your pocket?

> personally feel too sorry for you to complain because maybe you can't
> help your condition.

What condition? My aversion to people who cause me financial loss? If that is a condition then I guess I have one.

> But you really should seek help, seriously, OM,

Sorry Roland, but I'm not the one who is writing bad checks, receiving merchandise and not paying for it, not paying for C.O.D. shipments I have personally authorized to be shipped, etc., etc. like you have been for many years as it appears by all the replies and posts.

> Good Luck. Roland
>

> Well, you're are wrong again, Piero. Just to show you how screwed up

> you are I'm attaching a copy of my cellular telephone bill among many
> that get mailed to me every month

It is nice you can pay your cellular phone bill but you can't pay for your C.O.D. shipments, other packages you receive, etc., etc.

> you will please note my address.
> You simply don't understand how our system works here and are really
> making a fool of yourself.

Ohhh, I see, those of us who don't "understand" your system have to suffer financial loss.

> You are a prime example of attempts to
> misuse your badge and position.

If you consider me "misusing my badge and position" to bring light to your games then I guess I do. Hopefully, by posting these warnings, no one else will fall prey to your games. I also guess I "misuse" my badge every day I go to work when I arrest thieves, bad check writers, stop creeps from victimizing other people, etc., etc. I must be doing something right, I'm the highest decorated officer in my department and in the area so I guess no one in this area agrees with you

> It's called abuse of power

Wrong again, abuse of power is when, as a police officer, I commit a crime. Sorry, I haven't committed any crimes here. I haven't written bad checks, caused financial loss to others by having others ship C.O.D. packages and not paying for them, or worse yet, receiving items and just not paying for them as you have done.

> would have been immediately fired here in Arizona if not in your own
> precinct. Many of my friends, and one special one you'd be very, very
> surprised who I'm talking about, has personally suggested I not ignore
> your lies, and inflammatory statements, with my silence but that I
> respond to your lies.

I can back up my statements with copies of your e-mail messages (which I have kept) and every other aspect of our transaction. Also, if you look around you will see many others who have replied about similar problems...I guess we are all mistaken? I guess we are all lying and you are the only one telling the truth.

> The truth is with the evidence, I could sue you
> and very easily win, but you don't have any assets to attach.

And I have plenty of evidence. Please sue me, I'd be glad to see if the State of Arizona would fly two law enforcement officers here to pick me up, then transport me (fly of course) to Arizona for the civil trial. At the civil trial I would bring all the copies of our e-mails, my receipts, subpoena the other victims who have replied, and of course your court abstract from the Glendale District Attorney's Office. Oh, I forgot, the Governor of Pennsylvania won't sign an extradition order for

me to be taken to Arizona for a civil trial, and I don't think the State of Arizona is willing to spend thousands of dollars to process a civil service when they look at your track record. As far as my personal assets, I have many assets you could try to attach. I own a 3000 sq. ft. 4 bedroom, 2 1/2 bath home with an inground swimming pool. I own two modern cars and two antique cars, and I own a lot of other personal property. Speaking of assets, still living in an RV?

> All I
> could do is screw up your life with some ridiculous judgment I could
> never collect on.

You are correct there, Pennsylvania won't honor your ridiculous claims, and from what the Arizona Attorney General's office told me on the phone, they won't either.

> For what, I don't dislike you but instead hope you
> get better.

I would get better if you paid me the $132.58 you cost me from shipping that package to you and you not picking it up.

> You might consider that maybe you're burned out on your
> job, OM.

Sorry to disappoint you, but the professionals disagree with you.

>
> My friends and acquaintances have suggested I should reimburse you the
> amount FEDEX would have charged you only.

That would be better then the nothing I have received from you.

> Majority have said I
> shouldn't reimburse you anything because of your mouth.

I guess your "majority" has not suffered financial loss because of your actions. I told you not to play games, did you think I would just take this lying down like so many other of your victims?

> I feel It is
> not your fault but instead simply your ignorance of shipping
> conventions for which you shouldn't be penalized..

No, it is my fault for not insisting on payment up front with a postal money order and not shipping until I received the money up front. I trusted you when you said you would reimburse me after you failed to pick up the package when notified by the supervisor , I'll never make those two mistakes again! It cost me $132.58 to learn that lesson.

Piero

My wife and I are in disagreement over showing off my callsign on our car's license plate.

I say it's a vanity thing and is something that should be proud of.

She says it's a pride thing that will attract radio/antenna thefts and vandalism.

What do you think of it? Thanks.

Three words: Don't buy Icom.

Their quality control is lacking, and the only thing they stand behind after the sale is their voicemail system, which prevents you from talking to humans.

I owned an Icom 2700 (predecessor to the 2710) which went in for repairs 4 times under warranty, each time coming back with bigger problems than it went in with. The 2710 is a little better, but not much... Hot audio, flimsy mic, expensive PC programming hardware/software.

I dumped both my 2700 and 2710 in favor of a Yaesu FT-8500. The big mic with the joystick (the "Mr. Potato Head" mic) is intimidating at first, but after a short learning curve (less than a week of daily use), you'll be using the radio like a pro. It's built to last, has alphanumerics, and is menu driven to make changing settings easy. MUCH easier to use than the Icom 2710, and cheaper too... $400 for the radio, $60 for PL decode, $60 for the remote kit, and $40 for the programming cable and software. I doubt you could do better for less, and I'm not sure you could do better for more money.

I'm guessing the radio didn't sell well due to the Mr. Potato Head mic (the smaller palm mic is a pain to use, but looks more "normal"), and that's why it's so cheap now..

> bye, sid KC2COO

Don't feel bad Sid, Roland Geter specifies "his" conditions as he goes along. Even if you had met every one of his "conditions", you would still be out your $25.00. That was his excuse for not picking up the C.O.D. package I sent him as he specified, even when contacted by the supervisor at the Federal Express Depot in Phoenix, Arizona where he "does a lot of business". Yes, I also have suffered a loss, mine was a little more expensive to the tune of $132.58. I hope others won't fall victim to Roland Geter's shenanigans and they heed my warnings. You can also forget Roland Geter's false promises of making good also, I can send you his e-mails where he promises to reimburse me for the lost shipping charges AND wants me to reship the computer. Fortunately I demanded payment up front before I shipped this notebook computer again. Of course the postal money order never arrived.

An expensive lesson learned,
Piero

You are right, unfortunately he has Harold Lines buffaloed with his lies and deceptions. I will continue to warn others about Roland Geter until I am reimbursed for the monies I lost as a direct result of his scam. It is ashame Roland Geter doesn't come into my jurisdiction, this problem could be legally remedied immediately. I also hope others file complaints with the Maricopa County Sheriff's Office so legal action could be taken in Arizona...although some legal action already has been taken.

Dave; I have had Amateur Radio plates on my car, pick up truck and motor home for well over 10 years and never had a problem. Most people, especially the larcenous mentality types don't even know what the call sign plate means. If they are looking to steal, the antenna would draw them first cause they think it's for a CB that they could fence real quick to buy their drugs.

I had a vanity callsign plate on my car and never had any problems. Think of it this way...

Is a license plate really going to attract thieves? NO.

Will the antennas? PERHAPS.

I am probably making things worse there. Now she might say..."No radios or antennas."

Obviously, there is a concern for almost every car being broken into or even stolen. Just be careful where you are and where you park.
I wouldn't be too concerned about theft. If it's going to happen, it's going to happen. We shouldn't let stupid thieves run our lives. All you can do is be careful and make your car as secure as possible.

Hi David,

Personally, I was proud of mine. I had mine on the car for 5 years, and in all that time, not once did I have a break in. Had the same FT5100 for all that time.
I don't feel that it's a vanity issue. Most folk's have the impression that Amateur radio operators are nerds with pocket protectors, and broken glasses =) Ok, maybe some are.

Here's a good argument for you...

If you're callsign is on your car, you're more likely to drive better. I sent a letter to a ham that was dodging in and out of traffic, and then he cut me off! You can just imagine the look on his face when I got his info from his hamplate! You never know who's gonna be on the road.

Good luck!

Yo Ho
Maybe time to go
And show
the XYL
A new shiny grape-colored Tercel
Where she can hang a 16 digit state plate
and you can move up to an Olds 88
with your very own Hamity Plate

Besides 99 out of 100 "civilians" wouldn't have the foggest notion what
AF4BH stood for!!!

All in good fun
Rod in San Diego

P.S. My XYL's License plate bracket sez "Nurses Call All The Shots" --
thats why she has her own car.

Mine is AC6V -- A music Group some ask!!!

I did notify the Maricopa County Sheriff's Office who took
administrative action against Roland Geter. I also notified the Arizona
and Pennsylvania Attorney General's Office. Unfortunately, because of
the small amount ($132.58), they would rather reimburse me out of their
own funds instead of prosicuting Roland Geter for Theft by Deception.
Prosecution just isn't finacially fesable for bothe states. However, if
everone who has suffered a loss by Roland Geter would file a complaint,
maybe some further action would be taken.

Has anything similar been done for the Icom IC-T8A? I'd love to
get my hands on a Unix- (or Linux-) based programming system,
especially if it had open source code.

5702. Re: Dual band mobiles - Yaesu or Icom? Or Kenwood?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-29 00:00:00 UTC
From: Keith Casey <kd7afd@doitnow.com>
Message-ID: <6urlgj$a37$1@supernews.com>
Source record: 130718

Hi Brien,

I prefer the Kenwood TM-V7A radio. It is a dual band with all of the features you mention. Most of the other radios require option boards to cover all of the basic features. For instance, the FT-8100 requires a $69 CTCSS decode module.

One thing I really like about the Kenwood is the voice module. It costs about $35. It will announce the frequency or channel number you are on so you don't have to look at the radio while your driving down the road.

The TM-V7A has a feature called programmable memories. This feature gives you four "environments", actually five if you count the fact that you can turn off all environments. An example of how they would be used is:

Your drive to work in the morning with the radio set for VXV, 146.980 on one side and 147.240 on the other. You like the display dimmed quite a bit. You would set up the radio this way and store the settings to PM1.

During the work day you want the radio in VXU, with the display dimmed completely, and two way cross band function set on and repeater hang time turned on. Set up the radio this way and store the settings to PM2.

On the way home you want a bright display, VXU mode with 146.980 and 446.825. Set this up and store it to PM 3.

Whenever you need the morning set up, you just press PM then 1 and you'll be there. There are many ways to use this feature and it saves a lot of button pushing.

There is also the remote control. You can use any radio with dtmf to send control codes to the TM-V7A. See my web site at www.access1.net/kc7kc for more information on remote control.

The only significant complaint I've heard about the TM-V7A is the display. It is very large and easy to read under the right lighting conditions, but in direct sun light it is very difficult to read. I feel the voice module makes up for this, but not everyone agrees. Some people have mounted the remote faceplate above the windshield and report good viewing, but I have not tried this.

Anyway, it's worth checking out. I think it is less expensive than the other radio's you mentioned as well.

Good Luck es 73

My wife and I both have Ham license plates. My thinking is like others here, plates don't attract theives -- antennas might, but like others say, the average person hasn't a clue what a ham call looks like.

I constantly get asked " why does your plate say WARP??"

Go for it and enjoy it (at least you will always be able to fill in your plate number on forms).

My favorite memory is of a time I returned some memory chips (man were they cheap!). Anyway, I stupidly didn't double check before I left home and bought the wrong ones. Returning about six weeks later for a trip through the return line, which, as it is most of the time, is very short, I was greeted by a young man who spoke very broken English. I explained that I had bought the wrong chips and needed to return them. Being the savvy Fry's customer I am, I have all the paperwork in hand and proffer it to the clerk. He stares blankly at the papers for what must have been two full minutes, and I could sense my 15 year old's growing doubt that we will get to lunch before three o'clock. The clerk finally looks up ans says, "I am very sorry sir, but we have here a thirty day only return policy." I look him right in the eye and without missing a beat say, "Oh, that's OK because I have a sixty day return policy." Follows about 30 seconds of dead silence before

he answers, "OK, sir", and proceeds to cut the return sheet for me to take to the checkout.

My 15 year old, Tim, still laughs about that one.

Fry's, you gotta love 'em. Thanks for the laugh.

There are several good web sites for ARES. A couple of my
favorites are:

Colorado ARES http://www.iex.net/ares/ares.htm

California RACES http://www.garlic.com/oes/

I think that the ARRL has more info, www.arrl.org

If you just need a 2M HT, buy one on sale. Be sure that you
get an extra battery pack, preferably one that takes alkaline
batteries.

I have an excellent condition Realistic HTX-100 10 meter radio for sale. This rig has NOT been modified in any way. Have mike, mounting bracket, and manual for it.. May even have original box..

$125.00 O.B.O.

The Icom is a better than good condition handheld radio. One of the old ones with the thumb screws on the top. It has the PLL tone board installed with dip switches, for changing the tone, mounted in the back of the radio. It has an after market battery on it. It's a great first radio and is built to last.

$150.00 O.B.O.

How will you know your offer isn't the best unless you make it.

TRADES CONSIDERED!!!...

Looking for dual band mobile or 2 meter mobile for my truck.

Very uniquely - and reliably. There are a pair of sliding, spring-loaded pins that you move fore and aft to accomodate the packs' charge points. I regularly charge several different configurations of packs with no problem. Although I have never used it, Maha actually gives you the ruler markings and a "cheat sheet" to use for many different packs.

Check out the pictures and the Instruction manual at their site:

You are, I assume, refering to the "Sub-Display," which serves as the clock, alternate vfo freq display, and memory ch/freq display? If so, it is illuminated by two small incandescent bulbs, one at either end of the display, and centered top-to-bottom. Kenwood part number is B30-0835-08. Each bulb is supplied with a green sleeve to tint the light.

If your '940 does not have the autotuner, replacement is simple and easy. With the tuner it is a bit more complicated, but you can see how to do it by looking closely, if you are mechanically inclined. I've done mine!

I have a friend who uses one for motorcycle riding. It sounds like crud all the time. For hiking and biking the noise couldn't be that great that you would need a throat mike. In fact, for hiking, what's wrong with a hand mike? I also have a friend who bicycles regularly with his ht and a nice whip on the back. He uses a boom mike and a hand switch on the bars. He only sounds bad when he's going up-hill.

I am ignorant where radios are concerned. I figure you guys (& gals) know
just
about all there is to know about transmission and reception over the
airwaves.
Here is my probem:

I want to receive a standard am freq. radio broadcast at work. However I am
getting a constant ring in the background along with the broadcast. I have a
cheap
walmart type generic radio.

1) Can I do anything to remove the ring and any other outside interference?
2) Is there a best or better radio that I could buy that would allow me to
filter out
the junk?

Please respond to my e-mail account, thanks.

Thanks so much for any input.

It's a myth that Fry's prices are the best around - it only applies to the obsolete and broken. I guess people are taken in by the extensive TV advertising.

Last week, I checked out prices there on an Adaptec 2940UW - $250 - and a 3Com Etherlink - $80. My neighborhood store does the same items for $175 and $75 respectively. I'd prefer to pay a bit more than go to the dreaded F-store anyway.

I agree about returns to Fry's tho - as long as you pay by CC you're ok - except for the lines at peak hours.

I consider Fry's the absolute last resort - I go there only when all else fails.

5727. emergency communications for canoeists

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-29 00:00:00 UTC
From: Paul Lantz <plantz@onlink.net>
Message-ID: <6uqi5tdig1@onlink3.onlink.net>
Source record: 130810

A couple of friends of mine are fairly serious canoeists - they go on trips that last for several weeks at a time in remote areas. They know a bit about amateur radio and probably would get involved if they thought it could help them communicate while they are on trips.

I am interesting in hearing suggestions and especially comments from people who use amateur radio when they go out canoeing or camping.

Their major concern is to have a way of reporting an emergency. They have thought about having an emergency locator.

They are not particularly interested in having regular communications while they are out on trips - they would probably only make contact in case of emergency or a change in plans.

One thought I have is to use an HT to access a satellite such as AO-27, in most areas they would get at least one "good" pass. I have been able to make contacts through this satellite from an HT without too many problems but know that it would be impossible to have any kind of sustained conversation - I imagine they would be able to jump in to report an emergency, give out a location and ask someone to relay the message for them.

Another thought is to have some kind of HF gear but it would need to be fairly light.

They are going in areas where there is no cellular coverage and no repeaters.

They also don't want to spend a lot of money. An Iridium telephone would be ideal if $ was no object.

Thanks for your comments

73

I don't think that this guy was trying to play 'Newsgroup Police." It seems like he was making a polite personal request, and pointing out the convention that is the basis of his request.

There are still lot's of moderated groups. The more useful groups are often moderated.

A charter isn't precluded because a group isn't moderated. Many Non-alt groups are still formed by vote based on a charter.

FS, FA, FT, WT* just help buyers scan the group faster and are to the seller's advantage. If the group takes too much time to scan fewer people read it.

Useful newsgroups that run well rely on a fairly high level of courtesy and convention (unwritten rules if you prefer.) The swap groups are getting busier by the day. If people don't make best use of the subject lines, the groups will get to take so long to review that they will be useless to all but the most technically sophisticated users who can filter group content by subject and message content. This mode of operation is in the interest of very few users of any of the groups.

Personally, I don't finf the changing of the pin settings to be "inconvenient"
in the slightest. And most importantly - the Maha MH-C777a automatically
differentiates between NiCad and NiMH packs, and PROPERLY charges them.

5735. FS: Kenwood TS-830S station

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-29 00:00:00 UTC
From: Michael Melland <badger@vbe.com>
Message-ID: <3610DF23.1EC6@vbe.com>
Source record: 130818

For sale: All in excellent condition. Rig just back from International Radio last month and was checked out and given an "optimized alignment". Want to sell as a complete station, postal money order or cash, prefer pick-up so you can see it work or you pay shipping. Asking $1,250.00 for all - condition warrants price.

TS-830S - Gold Letters, new driver and finals, full output, full filters - 500 Hz in each IF and 2.4 SSB, optional KB-1 tuning knob, excellent condition.

VFO-230 - Matching digital VFO with 5 memories, excellent condition, with connection cable

AT-230 - Matching antenna tuner/meter, excellent condition

SP-230 - Matching speaker with filters, excellent condition

SM-220 - Matching station monitor with BS-8 pan adapter (band scope), all cables inc.

MC-50 - Matching microphone, very good condition

Autek QF1-A - Audio Filter/Notch, very good condition, poor man's DSP <grin>

Pair of new matched RCA 6146B finals, One set used but good finals, two new 12BY7A drivers, other misc stuff included such as original and a copy (1 of each) of operators manual and service manual, Heil connector for mike and PTT. This rig works great and has what has been known as one of the "hottest" receivers ever built. My first rig and very well cared for - I was second owner and it has never been in smokey environment. Interested parties please email or call me at (920)582-8638 after 5pm CST.

5740. FS: IC-735 and AT-150 automatic antenna tuner - MINT

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-30 00:00:00 UTC
From: Terry Brown <brownt@frl.orst.edu>
Message-ID: <36130A84.1C887D32@frl.orst.edu>
Source record: 130523
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I have a truly mint IC-735 Transceiver and Icom AT-150 matching
automatic antenna tuner. These have been seldom used because I
kept them as backups to my base station. Someone else might
as well get some use from them. Here are the particulars:

IC-735 Transceiver with 500hz CW narrow filter and electronic keyer
AT-150 Matching Antenna Tuner
IC-735 Service Manual
All instruction manuals and original boxes

Price: $950 FIRM ppd. in CONUS.

This price truly reflects the value of this equipment. If you are not
happy in any way after using for a week, just send back to me in
same condition I sent it to you and I will refund your money.

References on request.

Thanks for the info. Yes, I think with the display mike, extra battery packs, antenna's, 12 volt jacks for the car, it's worth that to me, if it does not sell, it doesn't sell. But I do appreciate this information.

Scott

5742. Kenwood TS-570S Memory Backup Lithium Battery

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-30 00:00:00 UTC
From: Jon Williams <JR.Williams@prodigy.net>
Message-ID: <6uv3k2$9ffc$1@newssvr04-int.news.prodigy.com>
Source record: 130525

Has anyone replaced the backup battery in a Kenwood TS-570? My radio is not holding memory information any longer and apparently the battery needs replacing. I don't want to send it in to Kenwood if I can do the replacing myself, but I don't want to try for the golden screwdriver award either with no instructions to keep me out of trouble.

Any knowledgeable advise would be appreciated.

Thanks!

Jon

5743. Re: BEWARE of Roland S. Geter, Sr. - Do your homework Harold!

You know, from reading these post, from Mr. Geter, I
got the impression from his early post that he actually
worked for the Sheriff's Office. Maybe it was just me.
But I wonder how fruitful it would be to file a formal
complaint with the Sheriff's Office, with a copy of the
early post that led me and probably others, to draw
the conclusion that Mr. Geter was 'officially' associated
with them. They may be able to provide some added
'influence'. Especially if you indicate satisfaction would
be achieved by being compensated, not by continuing
the complaint process.

If nothing else, you can stink it until the Sheriff's Office
wouldn't deal with Mr Geter if he gave them stuff for free.

Sometimes it's not right or wrong, correct or incorrect,
good or bad. It's strictly quieting the most annoying noise.

I have had callsign plates since 1989 with no problems other than trying to get New York to manufacture them correctly. I have 6 plates that were all done lopsided or split before the state started a new vanity program which solved alot of the problems. The only comment I ever heard about the plates was from someone who thought they were a New Yorkers comment on New Jersey Taxes. Callsign N2JTX.

Your FT-530 is not "priced-to-sell". Try about $275.00 for this
package and you'd be more in range. When they went off the market,
They were selling for about that new. Your display speaker mike makes
yours worth that used. HT's don't hold their value too well.

Yes...but it's Fry's policy and not mine! There is no law that says you
must accept a stores policy... 20 years ago a 10 day check refund was a
standard policy. Today a check will clear in lesss than 24 hours.
Think of the thousands, probably millions of dollars Fry's is sitting on
collecting interst for 10 to 14 days....

Robert,
The newly designed Amateur Radio license plates for NY are not considered
a "vanity" plate anymore, but fall under the category of Emergency Services.
Thus the reason one no longer get's charged the "Vanity" fees of the past.
The process to get them is a simple phone call to Albany followed by mailing
in a copies of you Amateur Radio License, Vehicle Registration, and $18.
During the "Vanity" days, you had several forms to fill out, and I believe it
cost $40 plus a renewal fee when it came time for reregistration.
I will have to agree with the majority and say that the antennas would be the
first thing that draws someone to a vehicle. Radio's that you can mount in say
the trunk, and remotely mount a removable control head can curb breakin's as
if they don't visually see it, they more than likely will move onto another
vehicle
that has easier/visual pickings.

One of the few intelligent posts inthis thread...

Personally, I do my research and homework BEFORE I go to any "superstore" to make a purchase. I know what I want, and know what it should cost. (All this "smart-ness" disappears, though, once I enter Ham Radio Outlet in Anaheim, CA. Once I walk in there, I become much to impulsive...<g>.)

try to go to http://www.hamradio.cz
there is an OM there who have written a little soft to clone the ICQ7 and it work.. I have tried...
I am very surprised than nobody seems to be interested by a pc programming for ICQ7....
They probably like to use the set only...hi

Message-ID: <6uufjc$ilm@login.freenet.columbus.oh.us>
Source record: 130608

I am active in the Central Ohio ARES and have used a throat mike
in a couple of situations. The first thing you want to do is try one out
"on the air" I own 2 (one for Kenwood and one for ICOM) and I am
understandable in impossiable situations. However I have a couple of
friends who as much as they would like are not understandable no matter
how they use this mike. (seems to be the baser voices). So try one befor
purchasing.

In my use I have used it in the OSU stadium during the various
rock concerts. In my first use it was during a "Pink Floyd" concert. I was
in front of one of the speaker towers facing them and I could not be
understood but as soon as I turned my back to the speakers I could be
understood. (Just needed to get the direct vibration off the mike).

However for the use you are requiring I would stay with a speaker
mike and an earphone or for a bit more hands-off operation a headset mike.

To me the throat mike is just another tool with a specific
application. IE: the right tool for the right job. I use this mike during
the concerts which we provide communications for the Red Cross First Aid
Service Core, during airport drills and/or disasters, etc. I use the
throat mike along with shooting muffs so I can hear as well.

You might want to look into the LMR400 cable from Times Microwave, it is easier to work with, is lighter, cheaper and has less loss than 9913 to boot... not bad, I'd say. Installing UHF connectors on it is a snap, too.

Isn't it that the antenna is "supposed" to be tuned so as to offer to the cable whatever the cable's impedance is... which is the only part of the system that you can't adjust with a screwdriver? Now, assuming that the antenna presents a real 50 ohm impedance to the 75 ohm line, you come out with... is it 1.25 to 1 SWR, or is it 1.5 to 1 (my calculator's not handy)? Neither of which is too shabby.
Cutting the line to electrical half wave lengths, at the operating frequency, is intended to offer the same impedance to the source (transmitter) as is presented to the cable by the load (antenna)... if 50 ohms then 50 ohms... but you still have the SWR on the line to contend with.
If the line has a very low loss and the transmitter doesn't get too upset, go for it.

I have dealt with this problem before but I cannot remember the solution.

My Century 21 had the VFO lock up when running it off the end. I know the fix has something to do with that spring loaded lever behind the vfo knob but, for the life of me, I cannot remember what it is.

HELP!!!

Source record: 130647

Like new -- it is almost 3 months old.

All cables, manual and box.

This tuner works GREAT and is 100% working.

I no longer have 6M and have long term plans to add a 500 W amp to my station so need to buy the 231's big brother, the SGC-235.

AES database price for new SGC-231's is $529.95 + shipping.

Asking $425.00 --cash, bank check, or money order. Includes insured 2nd day FedEx shipping.

Info in manual for connecting to IC-706 and DX-70 series radios.

>cut me off!

See, a nice guy like you just sends a letter. Someone else may send a more destructive package, or even pay a visit to your house.

I haven't gotten a vanity plate because I'm not too keen on revealing my identity, address, birthdate, ect to anyone that wants to spend a few minutes looking on a web site.

With that biographical information, its possible for someone to obtain all types of personal information such as property records, career information, and wth a little effort, credit information.

It's just a personal thing here, but I prefer not to share my identity with everyone who sees me.
Michael

5802. ****TRADE: TWO MOTOROLA SPIRIT VOICE PAGERS****

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-30 00:00:00 UTC
From: teenham@aol.com
Message-ID: <19980929232048.09053.00001097@ng12.aol.com>
Source record: 130652

Hey,

I have two Motorola Spirit Voice Pagers (dedicated frequency recievers) for trade. Both include special "custom size" Rechargeable NiCad batteries, one "drop in" charger and one "non-drop-in" charger (the non-drop-in charger can actually charge two batteries at the same time, but you must first remove them from the receiver. The drop in charger is a single reciever charger, but you just drop the pager in and it charges--- no removal of battery.) I'll include both chargers, and of course both belt-clips. Both units work great, and and are in good condition. Both are currently set to 138.325 MHz. I have been told there is a way to change the freq to anywhere from 136-165 MHz (+ or - some) by doing some modification to it, but I just don't have the tools or knowledge for it. Would be usefull for monitoring a 2m repeater, or maybe a fire company freq when all you need to do is listen. WHAT I AM LOOKING FOR IN A TRADE: The 2m amp that RadioShack just cleared out for $29, a glass mount 2m/440 antenna (non-used, of course,) a small base 2m/440 antenna (no home-brew's please,) cheap frequency counter, or just about any other ham radio related item. All offers considered. (In case you're wondering how much these recievers go for, last weekend a person at a hamfest was selling a pair of them for $45 without any charger and one battery.) *ALL OFFERS CONSIDERED* Please drop me an email.

Well Clint...I thought an agreement is when "two parties" have a mutual understanding??? What Fry's is doing is trying to force their policy on the public. There is no agreement, no contract. Infact Fry's hides their policy on the back of the receipts so you don't see it until you have paid for the item. "you" may choose to allow Fry's to dictate their policy to you.... That's ignorance!

>>I once saw one of their computor department employees go into a "Full
>>lockup condition" and almost melt down on the spot. I didn't realize
>>that this employee was already doing something for another customer. I

Humorous story clipped....

I bought a HP Pavillion PC at Frys a month ago, had one salesman help me, then he had to go take care of something. A bit later, a saleswoman (who saw me talking with the first guy) approaches me and we cut the paperwork and I buy machine. Later that day I return for a perifiral(sp) and first guy says "want to get that PC?". "I already did, your ladyfriend did it for me". "Who?" "I thought you were working together..." Well, it's not my problem, but it looks like Frys employees will shaft each other when chance appears.

Oh yeah, had a problem with the HP, it would randomly reboot even if I was actively using it. Apparently fixed by loading in a new video driver...

Suspect this is off charter for the boatanchors group....

Greetings,
I have an IC706MKII for sale. I won this radio at the Madison,
Ohio Hamfest 03/98.
The radio is in brand new condition. I only used it twice on 6 meters.
I have only approx. four hours of use with it. Due to my schedule. Box
and manuals. I am asking $950.00 or best offer. If interested please
either email me or you can call me at 440-352-7787. Thanks in advance.

I'm not sure WHY you need to cut this cable in multiple wave lengths or at a 65 foot length.

If the ANTENNA is tuned to a certain frequency, the impedance will be about 50 Ohms and the length of the cable is unimportant. And the slight mis-match will not affect matters too much.
The only time that the cable length becomes critical is on HF and only (in my opinion) when it becomes part of the tuning of the antenna.
Just roll out as much, or as little cable as you need.......

Likewise, I've had my call since 1957 and displayed it on vehicles since 1961. I respect others' rights to privacy, but I personally will not go through life in total anonymity for fear that "someone is lurking out there".

It is a personal choice, but one's fears should not rise to the level of irrationality.

Here's my bottom line, I never used this equipment much and am getting into Digital Video at this time. I want to sell to purchase digital video equipment.

The Yaesu 990 DC comes with the SP-6 external speaker and the Yaesu Tech ref manual. This unit is in brand new condition and has not been used much (less than 20 hours). $900 firm, you pay shipping. I will guarantee this unit to be as stated above or you send the unit back within a week of receipt and I'll give your money back. Would prefer to sell locally on the San Jose CA area.

Yaesu FT-530 HT with MH-29 mic and extras. In brand new condition with NEW 7.2v NiMH battery. Again, very little time on this unit. $375 firm.

Reply to Scott, KE6DFW, at scott@scottcovey.com or call 510-657-1818.

NO, unfortunately it requires the cards to operate. The cards contain a series of punched holes which connect each of the pins on the tube to the internal circuitry for the tester. There is a card for each part of a tube. Tubes like the dual triode 12AX7 require two cards, one for each triode. Without the cards, it's useless, except for parts. If I remember correctly, there were hundreds, if not thousands, of cards in the set.

Yah, a tiny bit. they were in the ARRL mag (QST) long ago, and
were built into a tuna tin. I misspelles tuna. sorry 'bout that, chief.

Look in the QST indexes, or ask the ARRL about them, and all the
data are in the mags.

Hope it helps.

Forget FT-8100R if you want to stay out of trouble.
My rig has broken three times within 10 months.
(twice soldering problems and third one is RF goes to mic line)
Also VX-1 has similar problems, so I am aftraid Yaesu's quality
is getting worse.

>Icom IC 2710
>Icom IC 706 MkII
There might be a problem with some Main Units.
My friend just had to change the unit, because of some
broken strip in multilayer pcb. The tx lost it's rf power time to time.
